2009 Opinions of the Property Tax Administrator for Nance County

My opinions and recommendations are stated as a conclusion based on all of the factors known to me regarding the assessment practices and statistical analysis for this county. See, Neb. Rev. Stat. §77-5027 (R. S. Supp., 2005). While the median assessment sales ratio from the Qualified Statistical Reports for each class of real property is considered, my opinion of the level of value for a class of real property may be determined from other evidence contained within this Reports and Opinions of the Property Tax Administrator. The resource used regarding the quality of assessment for each class of real property in this county are the performance standards issued by the International Association of Assessing Officers (IAAO). My opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

Residential Real Property

It is my opinion that the level of value of the class of residential real property in Nance County is 95.00% of actual value. It is my opinion that the quality of assessment for the class of residential real property in Nance County is in compliance with generally accepted mass appraisal practices.

Commercial Real Property

It is my opinion that the level of value of the class of commercial real property in Nance County is 94.00% of actual value. It is my opinion that the quality of assessment for the class of commercial real property in Nance County is in compliance with generally accepted mass appraisal practices.

Agricultural Land or Special Valuation of Agricultural Land

It is my opinion that the level of value of the class of agricultural or special value land in Nance County is 71.00% of actual value. It is my opinion that the quality of assessment for the class of agricultural land in Nance County is in compliance with generally accepted mass appraisal practices.

Dated this 7th day of April, 2009.

Nance County 2009 Assessment Actions taken to address the following property classes/subclasses:

Residential:

Annually the county conducts a market analysis that included the qualified residential sales that occurred from 1 July 2006 to 30 June 2008. The review and analysis is done to identify any adjustments or other assessment actions that are necessary to properly value the residential class of real property.

Annually, the county conducts the pick-up of new construction of the residential property in a timely manner.

Annually, the county plans to accomplish a portion of the required 6 year inspection process. For 2009, they have completed an on-site inspection and review of the improvement data on the rural and suburban record cards. This inspection process includes the houses and the associated outbuildings on the rural and suburban residential records. This process has been ongoing since 2007, and will be implemented in 2009.

For 2009, the residential assessment actions were a series of adjustments that were needed to improve the equity within the residential class of property. Specifically, the county adjusted the residential based on the analysis of the Assessor Locations:

- the Assessor Location Genoa; increased both land and improvements by 20%
- the Assessor Location Suburban Genoa; reviewed houses on a parcel by parcel basis and increased improvements by about 20%
- the Assessor Location Rural Genoa; reviewed houses on a parcel by parcel basis and increased improvements by about 20% (no sales in file for 2009)
- the Assessor Location Fullerton; (included both urban and suburban locations) increased both land and improvements by 5%
- the Assessor Location Sub-Fullerton Rec; (one subdivision with eight parcels) increased land values to \$3,500 per acre
- the Assessor Location Belgrade; increased land by 99% and improvements by 10%
- the Assessor Location Rural; updated both land and improvements

2009 Assessment Survey for Nance County

Residential Appraisal Information

(Includes Urban, Suburban and Rural Residential)

1.	Data collection done by:
	Assessor
2.	Valuation done by:
	Assessor
3.	Pickup work done by whom:
	Assessor
4.	What is the date of the Replacement Cost New data (Marshall-Swift) that are used to value this property class?
	2005
5.	What was the last year a depreciation schedule for this property class was developed using market-derived information?
	2006
6.	What approach to value is used in this class or subclasses to estimate the market value of properties?
	2006
7.	Number of Market Areas/Neighborhoods/Assessor Locations?
	6 -Assessor Locations
8.	How are these Market Areas/Neighborhoods/Assessor Locations defined?
	The areas that are in place in Nance County are the 3 towns, Fullerton, Genoa and Belgrade. The residential parcels outside the town limits are considered rural. These areas are identified in the "Assessor Location" section of the residential Statistics. Additionally, there are 2 small but unique areas just outside the city limits of Fullerton and Genoa. They are named Sub-Fullerton Rec, and Suburban Genoa. They are similar to, but not fully associated with the defined suburban for those towns.
9.	Is "Market Area/Neighborhoods/Assessor Locations" a unique usable valuation grouping? If not, what is a unique usable valuation grouping?
	Yes: The Residential Assessor Locations are considered the best strata available in the R&O to make subclass adjustments.
	I

10 Is there unique market significance of the suburban location as defined in Reg. **10-001.07B?** (Suburban shall mean a parcel of real estate property located outside of the limits of an incorporated city or village, but within the legal jurisdiction of an *incorporated city or village.*) Suburban location, as it is defined has no locational homogeneity and thus is an inappropriate stratum for adjustment for either the county or in the Statewide Equalization process. Parcels associated with this stratum have no consistent relationship with either the rural parcels or the urban parcels and often have characteristics of both. This stratum merely collects the parcels that are located in the land areas that immediately surround the various urban areas throughout the county. While there may be some relationship among the parcels in the proximity of an individual town, it is illogical to suggest any relationship exists among the collective parcels from all of the suburban areas throughout the county. 11. Are dwellings on agricultural parcels and dwellings on rural residential parcels valued in a manner that would provide the same relationship to the market? Explain? Yes

Residential Real Property

I. Correlation

RESIDENTIAL: The tables in the correlation section indicate that the statistics support a level of value for the residential class of property within the acceptable range. Analysis of the qualified PAD 2009 R&O Statistics for the residential class indicates that the median ratio is 95% and all of the relevant subclasses with a sufficient number of sales are within the acceptable range. The COD at 21.59 is not in the acceptable range and PRD at 108.18 is not in the acceptable range.

In this report are several stratifications that can be reviewed and analyzed: Under the stratification of Assessor Location; each of the named strata are likely to be relevant subclasses because they are assessor defined and should have both locational and organizational integrity. There are two other stratifications that may be of interest in the residential class of property. They are Locations: Urban, Suburban & Rural, and Status: Improved, Unimproved & IOLL. Both of these stratifications contain interesting and relevant assessment information. When taken alone as relevant subclasses, both present problems if they are broken down and analyzed as candidates for proposed adjustments. The biggest problem that is common to both is that none of the substrata in either stratification are related to a common location. The most important factor relating to value is and always has been location. The second but equally important problem is that assessors and appraisers rarely organize an analysis or valuation project according to those criteria. That means that some parts of each of these groupings are probably being reviewed, updated or appraised at different times and with different sets of considerations. Among the Locations: Urban, Suburban & Rural, the members of the urban group contain all of the individual towns scattered throughout the county and each subject to their own economic conditions. Suburban is similar with the same locational and economic disparity. Rural gathers everything else together as a catchall and then is often used to predict the valuation of agricultural houses. The grouping called rural may relate to the agricultural houses in some counties or in some parts of counties, but that is best left to the judgment of local experts. Nothing that is contained in the residential R&O Statistics can define those relationships. That leaves Assessor Location as the only stratification that is defined and supported by the assessor. Assessor Location will be the only stratification from which adjustment recommendations will be offered. Other groups with a reasonable number of sales and questionable statistics will be pointed out in order to be thorough but likely not recommended for adjustment.

Analysis:

Under the stratification of Assessor Location; no relevant substratum has a median ratio outside the acceptable range of 92 to 100%.

Collectively the data suggests that the median holds up as the best indication of the level of value for the class and probably each relevant subclass. There is no recommendation for adjustment.

II. Analysis of Percentage of Sales Used

This section documents the utilization of total sales compared to qualified sales in the sales file. Neb. Rev. Stat. 77-1327(2) (R. S. Supp., 2007) provides that all sales are deemed to be arm's length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the residential sales file. The Division periodically reviews the procedures utilized by the county assessor to qualify/disqualify sales.

The Standard on Ratio Studies, International Association of Assessing Officials, (2007), indicates that low levels of sale utilization may indicate excessive trimming by the county assessor. Excessive trimming, the arbitrary exclusion or adjustment of arm's length transactions, may indicate an attempt to inappropriately exclude arm's length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of residential real property.

	Total Sales	Qualified Sales	Percent Used
2009	208	137	65.87
2008	220	133	60.45
2007	166	105	63.25
2006	158	92	58.23
2005	180	114	63.33

RESIDENTIAL: Table II is indicative that the county has utilized an acceptable portion of the available sales and that the measurement of the class of property was done with all available arms length sales. Nothing in this data or in the assessment actions suggests a pattern of excessive trimming of sales.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio

The trended preliminary ratio is an alternative method to calculate a point estimate as an indicator of the level of value. This table compares the preliminary median ratio, trended preliminary median ratio, and R&O median ratio, presenting four years of data to reveal any trends in assessment practices. The analysis that follows compares the changes in these ratios to the assessment actions taken by the county assessor. If the county assessor's assessment practices treat all properties in the sales file and properties in the population in a similar manner, the trended preliminary ratio will correlate closely with the R&O median ratio. The following is the justification for the trended preliminary ratio:

Adjusting for Selective Reappraisal

The reliability of sales ratio statistics depends on unsold parcels being appraised in the same manner as sold parcels. Selective reappraisal of sold parcels distorts sales ratio results, possibly rendering them useless. Equally important, selective reappraisal of sold parcels (sales chasing) is a serious violation of basic appraisal uniformity and is highly unprofessional. Oversight agencies must be vigilant to detect the practice if it occurs and take necessary corrective action.

[To monitor sales chasing] A preferred approach is to use only sales that occur after appraised values are determined. However, as long as values from the most recent appraisal year are used in ratio studies, this is likely to be impractical. A second approach is to use values from the previous assessment year, so that most (or all) sales in the study follow the date values were set. In this approach, measures of central tendency must be adjusted to reflect changes in value between the previous and current year. For example, assume that the measure of central tendency is 0.924 and, after excluding parcels with changes in use or physical characteristics, that the overall change in value between the previous and current assessment years is 6.3 percent. The adjusted measure of central tendency is $0.924 \times 1.063 = 0.982$. This approach can be effective in determining the level of appraisal, but measures of uniformity will be unreliable if there has been any meaningful reappraisal activity for the current year.

Gloudemans, Robert J., Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 315.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio Continued

	Preliminary Median	% Change in Assessed Value (excl. growth)	Trended Preliminary Ratio	R&O Median
2009	86	9.60	94	95
2008	94.08	3.25	97	94.08
2007	99	0.80	99	99
2006	92	12.13	104	99
2005	102	-0.40	102	99

RESIDENTIAL: The relationship between the trended preliminary ratio and the R&O median ratio suggests the valuation process is applied to the sales file and assessed population in a similar manner. The county has a strong recent history of very similar changes in the two statistics that are recorded in this table. That suggests a pattern of good assessment practices is ongoing in this property type. This table indicates that the statistics in the R&O can be relied on to measure the level of value for this class of property.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value

This section analyzes the percentage change of the assessed values in the sales file, between the 2009 Preliminary Statistical Reports and the 2009 R&O Statistical Reports, to the percentage change in the assessed value of all real property base, by class, reported in the 2008 County Abstract of Assessment for Real Property, Form 45, excluding growth valuation, compared to the 2008 Certificate of Taxes Levied (CTL) Report. For purposes of calculating the percentage change in the sales file, only the sales in the most recent year of the study period are used. If assessment practices treat sold and unsold properties consistently, the percentage change in the sales file and assessed base will be similar. The analysis of this data assists in determining if the statistical representations calculated from the sales file are an accurate measure of the population. The following is justification for such an analysis:

Comparison of Average Value Changes

If sold and unsold properties are similarly appraised, they should experience similar changes in value over time. Accordingly, it is possible to compute the average change in value over a selected period for sold and unsold parcels and, if necessary, test to determine whether observed differences are significant. If, for example, values for vacant sold parcels in an area have increased by 45 percent since the previous reappraisal, but values for vacant unsold parcels have increased only 10 percent, sold and unsold parcels appear to have not been equally appraised. This apparent disparity between the treatment of sold and unsold properties provides an initial indication of poor assessment practices and should trigger further inquiry into the reasons for the disparity.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value Continued

% Change in Total
Assessed Value in the Sales File

% Change in Total Assessed Value (excl. growth)

15.38	2009	9.60
2.98	2008	1.58
0.98	2007	0.80
20.86	2006	12.13
-1.46	2005	-0.40

RESIDENTIAL:In 2009, the apparent change in the sales file of about 15% overstates the change due to assessment actions and is merely a quirk based on the change calculation in the measurement methodology. The median for the class increased 9% between the preliminary and the final statistics. The weighted mean increased 11% and the mean about 12%. With only 137 total sales in a residential sales file it is unlikely that the change in the sales file statistic is meaningful, particularly since it is considerably greater than any of the overall measures of central tendency. The assessor targeted adjustments of numerous subclasses and inspected and updated others. It is not uncommon to have this statistic behave erratically with the changes that were made in 2009. It is safe to say that the change to the assessed base indicates the change to the class. The statistics may not be representative of the class in this case.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization; to ensure proper funding distribution of aid to political subdivisions, particularly when the distribution in part is based on the assessable value in that political subdivision, Standard on Ratio Studies, International Association of Assessing Officers, (2007). The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios Continued

	Median	Wgt. Mean	Mean
R&O Statistics	95	93	100

RESIDENTIAL: The three measures of central tendency all are within the acceptable range and relatively similar, suggesting the level of value for this class of property is within the acceptable range. The median ratio is in the middle, the mean ratio is at the top of the range and the weighted mean is near the bottom of the range. This is not an unusual relationship among the three statistics since even a modest undervaluation of higher priced property can reduce the average assessed value and result in a lower weighted mean. Conversely, a modest over assessment of lower value property can produce very high ratios which strongly influence the mean. The median is the measure of central tendency to be least influenced by outliers, and in this class, the most reliable indicator of the level of value.

VI. Analysis of R&O COD and PRD

In analyzing the statistical data of assessment quality, there are two measures primarily relied upon by assessment officials. The Coefficient of Dispersion, COD, is produced to measure assessment uniformity. A low COD tends to indicate good assessment uniformity as there is a smaller spread or dispersion of the ratios in the sales file. A COD of less than 15 suggests that there is good assessment uniformity. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 235-237. The IAAO has issued performance standards for major property groups:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

The Price Related Differential, PRD, is produced to measure assessment vertical uniformity (progressivity or regressivity). For example, assessments are considered regressive if high value properties are under-assessed relative to low value properties. A PRD of greater than 100 suggests that high value properties are relatively under-assessed. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 239-240. A PRD of less than 100 indicates that high value properties are relatively over-assessed. As a general rule, except for small samples, a PRD should range between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

The analysis in this section indicates whether the COD and PRD meet the performance standards described above.

	COD	PRD
R&O Statistics	21.59	108.18
Difference	6.59	5.18

RESIDENTIAL:In this class of property, both the coefficient of dispersion and price related differential are outside the acceptable range. The interpretation of high COD and PRD is that the class of property has not been valued uniformly and proportionately. Like many counties with similar demographics, the county has done a statistically respectable job on residences which sold for \$30,000 or more. They struggle with the lower price parcels. Taking into account the presence of small dollar sales and the population range of towns from 134 to 1,378, it is difficult to manage the quality statistics in databases with these characteristics. It might be said that there is typically very little organized market structure in small villages and the balance between supply and demand is more coincidence than market forces. A review of the assessment actions reveals a very proactive assessment process for 2009. Even though the quality of the residential valuation may be considered less than acceptable, the assessment practices are solid and consistent in spite of the measured COD and PRD.

VII. Analysis of Change in Statistics Due to Assessor Actions

This section compares the statistical indicators from the Preliminary Statistical Reports to the same statistical indicators from the R&O Statistical Reports. The analysis that follows explains the changes in the statistical indicators in consideration of the assessment actions taken by the county assessor.

	Preliminary Statistics	R&O Statistics	Change
Number of Sales	138	137	-1
Median	86	95	9
Wgt. Mean	82	93	11
Mean	88	100	12
COD	24.88	21.59	-3.29
PRD	108.20	108.18	-0.02
Minimum	37.78	45.33	7.55
Maximum	207.00	318.00	111.00

RESIDENTIAL: The change between the preliminary statistics and the Reports and Opinion statistics is consistent with the assessment actions reported by the county for this class of property. There was 1 sale that were qualified and included in the final sales file that was not in the preliminary sales file. The changes shown between the Preliminary Statistics and the Final R&O Statistics were all considered to be favorable ones and depict a sound assessment process.

VIII. Trended Ratio Analysis

In order to be meaningful, statistical inferences must be based on a representative and proportionate sample of the population. If the sales are representative of the population and the sales have been appraised in a similar manner to the unsold properties, statistical inferences should be substantially the same as statistics developed from actual assessed value. This comparison is to provide additional information to the analyst in determining the reliability of the statistical inference.

	R&O Statistics	Trended Ratio	Difference
Number of Sales	137	132	5
Median	95	93	2
Wgt. Mean	93	94	-1
Mean	100	104	-4
COD	21.59	34.01	-12.42
PRD	108.18	110.32	-2.14
Minimum	45.33	10.56	34.77
Maximum	318.00	404.22	-86.22

There are numerous small dollar sales in this sample (just over 17% below \$10,000) which accounts for a large portion of the outlier ratios and consequently inferior quality statistics. The data gathering is done in such a way that some sales that might be substantially changed but are wrongly included and others that should be included are not discovered. With that in mind, it is not surprising that the quality statistics are inferior to the R&O statistics. In Nance County, the median and weighted mean are in the acceptable range and the mean is noticeably above the range. This table lends fair support for the R&O statistics, as they parallel each other. The trended statistics on their own suggest that perhaps the level of value is very similar to the level that the R&O statistics suggest. The quality of assessment may also not be represented by either of the two sets of statistics, rather exists somewhere in between. Since this is the first year preparing these statistics, no precedence exists from which one might draw any strong conclusions.

Nance County 2009 Assessment Actions taken to address the following property classes/subclasses:

Commercial:

Annually the county conducts a market analysis that included the qualified commercial sales that occurred from 1 July 2005 to 30 June 2008. The review and analysis is done to identify any adjustments or other assessment actions that are necessary to properly value the commercial class of real property.

Annually, the county conducts the pick-up of new construction of the commercial property in a timely manner.

Typically, the county plans to accomplish a portion of the required 6 year inspection process. There was no commercial inspection done for 2009. Instead they concentrated their efforts on the improvements on the agricultural and rural residential parcels.

For 2009, Nance County adjusted commercial property in the town of Fullerton; they increased both land and improvements by 10%.

2009 Assessment Survey for Nance County

Commercial/Industrial Appraisal Information

1.	Data collection done by:
	Assessor
2.	Valuation done by:
	Assessor and contract appraiser
3.	Pickup work done by whom:
	Assessor and contract appraiser
4.	What is the date of the Replacement Cost New data (Marshall-Swift) that are used to value this property class?
	2002
5.	What was the last year a depreciation schedule for this property class was developed using market-derived information?
	2002
6.	When was the last time that the Income Approach was used to estimate or establish the market value of the properties in this class?
	N/A
7.	What approach to value is used in this class or subclasses to estimate the market value of properties?
	The cost approach less depreciation derived from the market is used. Annually, the county analyzes the available sales and if needed, adjusts the values or recalibrates the depreciation. A sales comparison approach was done in 2004 by Jeff White
	Appraisal. This approach is correlated with the cost approach when it is applicable.
8.	Number of Market Areas/Neighborhoods/Assessor Locations?
	4: There are only 2 used in the 2009 R&O.
9.	How are these Market Areas/Neighborhoods/Assessor Locations defined?
	The areas that are in place in Nance County are the 3 towns, Fullerton, Genoa and Belgrade. The commercial parcels outside the town limits are considered rural. These areas are identified in the "Assessor Location" section of the commercial statistics. In 2009, no sales occurred in Belgrade or the rural areas.

10.	Is "Market Area/Neighborhood/Assessor Location" a unique usable valuation grouping? If not, what is a unique usable valuation grouping?
	Yes: Normally, the commercial Assessor Locations are considered the best strata
	available in the R&O to make subclass adjustments. In 2009, there are so few sales
	that it is not advisable to try to draw any conclusions from these subclasses.
11.	Do the various subclasses of Commercial Property such as convenience stores,
	warehouses, hotels, etc. have common value characteristics?
	In some instances, there is sufficient data to make internal adjustments to some of the more predominant occupancies, or to groupings of similar occupancies. Typically, it is uncommon to have sufficient data within a 3 year measurement
	period to initiate an adjustment to most of the occupancies. It is more typical to monitor occupancies or groups and make changes based on observed trends, or to identify them for inspection and revaluation.
12.	Is there unique market significance of the suburban location as defined in Reg.
	10-001.07B? (Suburban shall mean a parcel of real property located outside of the
	limits of an incorporated city or village, but within the legal jurisdiction of an incorporated city or village.)
	Suburban location, as it is defined has no locational homogeneity and thus is an inappropriate stratum for adjustment for either the county or in the Statewide Equalization process. In 2009, Nance County has only 1 parcel in this stratum.

Commerical Real Property

I. Correlation

COMMERCIAL: The tables in the correlation section indicate that the statistics support a level of value for the commercial class of property within the acceptable range. Analysis of the qualified PAD 2009 R&O Statistics for the commercial class indicates that the median ratio is 94% and all of the relevant subclasses with a sufficient number of sales are within the acceptable range. The COD at 14.17 is the acceptable range and PRD at 100.97 is in the acceptable range.

Analysis of the statistics prepared for the commercial class presents few opportunities to do any subclass analysis or recommendations for adjustment to a relevant subclass. No matter how sales are grouped in the commercial class, there are problems identifying relevant subclasses. These statistics have all of the problems of locational and organizational integrity that the residential statistics plus at least two more. First, there are never very many commercial sales even using a three year study. Second, commercial property is a collection of income producing land and structures that have little or no economic connection to each other. In the end, the only relevant stratification presented in the R&O is the Assessor Location, and even it is weak as an appraisal class. It is assessor defined and usually has locational integrity and to some extent organizational integrity if the assessor or appraiser recognizes the individual economic conditions that exist among the various uses grouped into the commercial class. At least, the assessor is likely to review, appraise and adjust the properties as they are grouped under Assessor Location in the same general time frame. Among commercial properties, there are simply less sales and more subclasses making subclass analysis and adjustment typically ill advised.

Beside Assessor Location; there are two other stratifications that have been of interest in the commercial class of property. They are Locations: Urban, Suburban & Rural, and Status: Improved, Unimproved & IOLL. Both of these stratifications contain interesting and relevant assessment information. When taken alone as relevant subclasses, both present problems if they are broken down and analyzed as candidates for proposed adjustments.

Analysis:

Under the stratification of Assessor Location; no relevant substratum has a median ratio outside the acceptable range of 92 to 100%. With only 11 sales this stratification really does not reveal much about the level of value. Even so, the county reacted to the low preliminary ratio in Fullerton and adjusted the subclass.

Collectively the data suggests that the median holds up as the best indication of the level of value for the class and probably each relevant subclass and no recommendations are offered for adjustments to the commercial class of property.

II. Analysis of Percentage of Sales Used

This section documents the utilization of total sales compared to qualified sales in the sales file. Neb. Rev. Stat. 77-1327(2) (R. S. Supp., 2007) provides that all sales are deemed to be arm's length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the residential sales file. The Division periodically reviews the procedures utilized by the county assessor to qualify/disqualify sales.

The Standard on Ratio Studies, International Association of Assessing Officials, (2007), indicates that low levels of sale utilization may indicate excessive trimming by the county assessor. Excessive trimming, the arbitrary exclusion or adjustment of arm's length transactions, may indicate an attempt to inappropriately exclude arm's length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of residential real property.

	Total Sales	Qualified Sales	Percent Used
2009	33	11	33.33
2008	29	11	37.93
2007	29	8	27.59
2006	35	10	28.57
2005	35	14	40.00

COMMERCIAL: Table II is intended to indicate that the county has utilized an acceptable portion of the available sales and that the measurement of the class of property was done with all available arms length sales. The percentage used in this county has ranged from 28 to 65% and number of qualified sales has ranged from 8 to 26 over the history of this statistic. In 2009, 33% is just above the low end of the utilization percentage and the use of 11 qualified sales is also near the low end of the range. Both statistics are fairly low for Nance County and they are fairly low for commercial property among peer counties. There were no sales removed between the preparation of the preliminary and final statistics. In the end, the 2009 statistic standing alone or as a pattern might raise the concern of excessive trimming of sales. Since the historical utilization pattern is fairly typical, it would be wrong to conclude that the county is trimming good sales. Nance County simply does not have much sales activity among the commercial property.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio

The trended preliminary ratio is an alternative method to calculate a point estimate as an indicator of the level of value. This table compares the preliminary median ratio, trended preliminary median ratio, and R&O median ratio, presenting four years of data to reveal any trends in assessment practices. The analysis that follows compares the changes in these ratios to the assessment actions taken by the county assessor. If the county assessor's assessment practices treat all properties in the sales file and properties in the population in a similar manner, the trended preliminary ratio will correlate closely with the R&O median ratio. The following is the justification for the trended preliminary ratio:

Adjusting for Selective Reappraisal

The reliability of sales ratio statistics depends on unsold parcels being appraised in the same manner as sold parcels. Selective reappraisal of sold parcels distorts sales ratio results, possibly rendering them useless. Equally important, selective reappraisal of sold parcels (sales chasing) is a serious violation of basic appraisal uniformity and is highly unprofessional. Oversight agencies must be vigilant to detect the practice if it occurs and take necessary corrective action.

[To monitor sales chasing] A preferred approach is to use only sales that occur after appraised values are determined. However, as long as values from the most recent appraisal year are used in ratio studies, this is likely to be impractical. A second approach is to use values from the previous assessment year, so that most (or all) sales in the study follow the date values were set. In this approach, measures of central tendency must be adjusted to reflect changes in value between the previous and current year. For example, assume that the measure of central tendency is 0.924 and, after excluding parcels with changes in use or physical characteristics, that the overall change in value between the previous and current assessment years is 6.3 percent. The adjusted measure of central tendency is 0.924 x 1.063 = 0.982. This approach can be effective in determining the level of appraisal, but measures of uniformity will be unreliable if there has been any meaningful reappraisal activity for the current year.

Gloudemans, Robert J., Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 315.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio Continued

	Preliminary Median	% Change in Assessed Value (excl. growth)	Trended Preliminary Ratio	R&O Median
2009	90	5.31	95	94
2008	89.47	3.45	93	93.94
2007	93	5.44	98	93
2006	97	-0.99	96	97
2005	97	-0.18	97	97

COMMERCIAL: The relationship between the trended preliminary ratio and the R&O median ratio suggests the valuation process is applied to the sales file and assessed population in a similar manner. The county has a strong recent history of very similar changes in the two statistics that are recorded in this table. That suggests a pattern of good assessment practices is ongoing in this property type. This table indicates that the statistics in the R&O can be relied on to measure the level of value for this class of property.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value

This section analyzes the percentage change of the assessed values in the sales file, between the 2009 Preliminary Statistical Reports and the 2009 R&O Statistical Reports, to the percentage change in the assessed value of all real property base, by class, reported in the 2008 County Abstract of Assessment for Real Property, Form 45, excluding growth valuation, compared to the 2008 Certificate of Taxes Levied (CTL) Report. For purposes of calculating the percentage change in the sales file, only the sales in the most recent year of the study period are used. If assessment practices treat sold and unsold properties consistently, the percentage change in the sales file and assessed base will be similar. The analysis of this data assists in determining if the statistical representations calculated from the sales file are an accurate measure of the population. The following is justification for such an analysis:

Comparison of Average Value Changes

If sold and unsold properties are similarly appraised, they should experience similar changes in value over time. Accordingly, it is possible to compute the average change in value over a selected period for sold and unsold parcels and, if necessary, test to determine whether observed differences are significant. If, for example, values for vacant sold parcels in an area have increased by 45 percent since the previous reappraisal, but values for vacant unsold parcels have increased only 10 percent, sold and unsold parcels appear to have not been equally appraised. This apparent disparity between the treatment of sold and unsold properties provides an initial indication of poor assessment practices and should trigger further inquiry into the reasons for the disparity.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value Continued

% Change in Total
Assessed Value in the Sales File

% Change in Total Assessed Value (excl. growth)

10.84	2009	5.31
4.99	2008	3.29
0.00	2007	5.44
0.00	2006	-0.99
0.00	2005	-0.18

COMMERCIAL:In 2009, the apparent change in the sales file of nearly 11% overstates the change due to assessment actions and is merely a quirk based on the change calculation in the measurement methodology. The median for the class increased only 4% between the preliminary and the final statistics. The weighted mean increased 5% and the mean about 5%. With only 11 total sales in a commercial sales file it is unlikely that the sales file change represents anything and the change to the assessed base indicates the change to the class. The assessor targeted an adjustment of about 10% to one town so the change calculated for this table only establishes that the statistic is an anomaly. The statistics, including the preliminary median of 90% probably are not representative of the class in this case.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization; to ensure proper funding distribution of aid to political subdivisions, particularly when the distribution in part is based on the assessable value in that political subdivision, Standard on Ratio Studies, International Association of Assessing Officers, (2007). The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios Continued

	Median	Wgt. Mean	Mean
R&O Statistics	94	94	95

COMMERCIAL: The three measures of central tendency all are within the acceptable range and very similar, suggesting the level of value for this class of property is within the acceptable range. These statistics standing alone may be somewhat indicative of the level of value only because the market is static and the assessment actions were modest, and targeted to produce better uniformity. The class is highly diverse, making the likelihood remote that the statistics for the class are meaningful or representative, and for any subclasses the likelihood is even more remote. The historical level of value and the pattern of ongoing and targeted assessment practices are more persuasive that the level of value for the commercial property is being maintained at the proper level than one more year of statistics.

VI. Analysis of R&O COD and PRD

In analyzing the statistical data of assessment quality, there are two measures primarily relied upon by assessment officials. The Coefficient of Dispersion, COD, is produced to measure assessment uniformity. A low COD tends to indicate good assessment uniformity as there is a smaller spread or dispersion of the ratios in the sales file. A COD of less than 15 suggests that there is good assessment uniformity. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 235-237. The IAAO has issued performance standards for major property groups:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

The Price Related Differential, PRD, is produced to measure assessment vertical uniformity (progressivity or regressivity). For example, assessments are considered regressive if high value properties are under-assessed relative to low value properties. A PRD of greater than 100 suggests that high value properties are relatively under-assessed. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 239-240. A PRD of less than 100 indicates that high value properties are relatively over-assessed. As a general rule, except for small samples, a PRD should range between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

The analysis in this section indicates whether the COD and PRD meet the performance standards described above.

	COD	PRD
R&O Statistics	14.17	100.97
Difference	0.00	0.00

COMMERCIAL: The coefficient of dispersion and the price related differential are both well indicating this class of property has been valued uniformly the range; proportionately. That said, commercial the quality statistics (good or bad), in low population counties are both more a coincidence of the data than a good indicator of assessment Before making any blanket statements about the assessment uniformity of the overall county, certain demographics should be mentioned. First, the commercial property is represented by sales in extremely diverse locations, including the county seat, two other villages and rural locations. Among the 11 commercial sales, there were 9 different occupancy codes listed, each with the potential to be operating in a different economic environment. might be said that there is very little organized market structure that is common to all of the far reaching locations or to all of the different property uses. With all of these variables, the commercial class is far too small to make either realistic adjustments or profound statements about the quality of assessment. Considering all of these variables and the size of the sample, there is little chance that the COD and the PRD tell much about the actual quality of assessment.

VII. Analysis of Change in Statistics Due to Assessor Actions

This section compares the statistical indicators from the Preliminary Statistical Reports to the same statistical indicators from the R&O Statistical Reports. The analysis that follows explains the changes in the statistical indicators in consideration of the assessment actions taken by the county assessor.

	Preliminary Statistics	R&O Statistics	Change
Number of Sales	11	11	0
Median	90	94	4
Wgt. Mean	89	94	5
Mean	90	95	5
COD	15.18	14.17	-1.01
PRD	100.64	100.97	0.33
Minimum	60.80	71.87	11.07
Maximum	136.18	149.80	13.62

COMMERCIAL: The change between the preliminary statistics and the Reports and Opinion statistics is consistent with the assessment actions reported by the county for this class of property. The changes shown between the Preliminary Statistics and the Final R&O Statistics were all considered to be favorable ones and depict a sound assessment process.

Nance County 2009 Assessment Actions taken to address the following property classes/subclasses:

Agricultural:

Annually the county conducts a market analysis that included the qualified agricultural land sales that occurred from 1 July 2005 to 30 June 2008. The review and analysis is done to identify any adjustments or other assessment actions that are necessary to properly value the agricultural land class of real property. After completing the analysis, the county prepares new value schedules for each market area.

Annually, the county conducts the pick-up of new construction of the agricultural improvements and updates any known land use changes in a timely manner.

Annually, the county plans to accomplish a portion of the required 6 year inspection process. For 2009, they have completed an on-site inspection and review of the improvement data on the rural and suburban record cards. This inspection process includes the houses and the associated outbuildings on the rural and suburban agricultural records. This process has been ongoing since 2007, and will be implemented in 2009.

The agricultural sales were verified and analyzed, resulting in value changes to the 4 market areas, and then a new schedule of LCG values for each area. The changes that resulted varied from market area to market area and among the LCGs. In the end, Nance County again made a significant change to most classes and subclasses throughout the county.

The county has finished the update of land use using Central Platte NRD maps. This action was a cooperative effort focused on coordinating the irrigated acres on the county files and the corresponding NRD records and some FSA records.

Additionally, the county has started working on a GIS system. Currently they are converting the cadastral maps and to date, have completed a few townships.

2009 Assessment Survey for Nance County

Agricultural Appraisal Information

1.	Data collection done by:								
	Assessor								
2.	Valuation done by:								
	Assessor								
	TP: 1 1								
3.	Pickup work done by whom:								
	Assessor								
4.	Does the county have a written policy or written standards to specifically								
••	define agricultural land versus rural residential acreages?								
	No written policy, however, the county indicated that they follow the Rules and								
	Regulations and State Statutes that pertain to agricultural land.								
a.	How is agricultural land defined in this county?								
	According to the statutes and regulations.								
5.	When was the last date that the Income Approach was used to estimate or								
٥.	establish the market value of the properties in this class?								
	The income approach is not being used to value agricultural land.								
6.	If the income approach was used, what Capitalization Rate was used?								
	N/A								
7.	What is the date of the soil survey currently used?								
7.	1955								
8.	What date was the last countywide land use study completed?								
	2009								
a.	By what method? (Physical inspection, FSA maps, etc.)								
	FSA and NRD registrations and maps are typically used. The county mailed								
	questionnaires to sellers and buyers about land use. One additional tool that the								
	county has used to confirm current land use is the current registered groundwater wells from the Nebraska Department of Natural Resources.								
	wens from the recordska Department of realthful Resources.								
b.	By whom?								
	Assessor and staff								

c.	What proportion is complete / implemented at this time?
	100%
9.	Number of Market Areas/Neighborhoods/Assessor Locations in the
	agricultural property class:
	4: -Market Areas
10.	How are Market Areas/Neighborhoods/Assessor Locations developed?
	The areas are defined by similar soil types and topography.
11.	In the assessor's opinion, are there any other class or subclass groupings, other than LCG groupings, that are more appropriate for valuation?
	Yes or No
	No
a.	If yes, list.
	N/A
12.	In your opinion, what is the level of value of these groupings?
	N/A
13.	Has the county implemented (or is in the process of implementing) special valuation for agricultural land within the county?
	No, Nance County has not identified any value differences due to non-agricultural influences.

Agricultural Land

I. Correlation

AGRICULTURAL UNIMPROVED: The tables in the correlation section indicate that the statistics support a level of value for the agricultural land class of property within the acceptable range. Analysis of the qualified PAD 2009 R&O Statistics for the agricultural land class indicates that the median ratio is 71% and all of the relevant subclasses with a sufficient number of sales are within the acceptable range. The COD at 16.01 is in the acceptable range and PRD at 103.57 is not in the acceptable range.

Analysis of the statistics prepared for the agricultural land class presents few opportunities to do any subclass analysis or recommendations for adjustment to a relevant subclass. No matter how sales are grouped in the agricultural land class, there are problems identifying relevant subclasses. The only relevant stratification presented in the R&O is the Area (Market). It is assessor defined and usually has locational integrity, geographic similarity and organizational integrity. Typically the assessor or appraiser recognizes the individual economic conditions that exist among the various market areas that stratify the agricultural land class. The assessor is likely to review, appraise and adjust the properties as they are grouped under Area (Market). A second analysis process available in the R&O that relates indirectly to the assessor acknowledged use subclasses of; Irrigated Land, Dry Land & Grass Land, is the analysis of the three Majority Land Use stratifications. They are relevant to the appraisal of agricultural land, but cannot be used to predict the statistical results of any adjustments within the R&O. If the prediction of the statistical impact is important, these stratifications though interesting become useless. That said; there may be instances when a recommendation will be made to adjust by land value by use, based on the Majority Land Use tables.

Analysis:

Under the stratification of Market Area; no relevant substratum has a median ratio outside the acceptable range of 69 to 75%. This suggests that the median holds up as the best indication of the level of value for the class and each relevant subclass and no adjustments are recommended.

II. Analysis of Percentage of Sales Used

This section documents the utilization of total sales compared to qualified sales in the sales file. Neb. Rev. Stat. 77-1327(2) (R. S. Supp., 2007) provides that all sales are deemed to be arm's length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the residential sales file. The Division periodically reviews the procedures utilized by the county assessor to qualify/disqualify sales.

The Standard on Ratio Studies, International Association of Assessing Officials, (2007), indicates that low levels of sale utilization may indicate excessive trimming by the county assessor. Excessive trimming, the arbitrary exclusion or adjustment of arm's length transactions, may indicate an attempt to inappropriately exclude arm's length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of residential real property.

	Total Sales	Qualified Sales	Percent Used
2009	83	48	57.83
2008	96	44	45.83
2007	98	38	38.78
2006	106	43	40.57
2005	102	48	47.06

AGRICULTURAL UNIMPROVED: Table II is indicative that the county has utilized an acceptable portion of the available sales and that the measurement of the class of property was done with all available arms length sales. Nothing in this data or in the assessment actions suggests a pattern of excessive trimming of sales.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio

The trended preliminary ratio is an alternative method to calculate a point estimate as an indicator of the level of value. This table compares the preliminary median ratio, trended preliminary median ratio, and R&O median ratio, presenting four years of data to reveal any trends in assessment practices. The analysis that follows compares the changes in these ratios to the assessment actions taken by the county assessor. If the county assessor's assessment practices treat all properties in the sales file and properties in the population in a similar manner, the trended preliminary ratio will correlate closely with the R&O median ratio. The following is the justification for the trended preliminary ratio:

Adjusting for Selective Reappraisal

The reliability of sales ratio statistics depends on unsold parcels being appraised in the same manner as sold parcels. Selective reappraisal of sold parcels distorts sales ratio results, possibly rendering them useless. Equally important, selective reappraisal of sold parcels (sales chasing) is a serious violation of basic appraisal uniformity and is highly unprofessional. Oversight agencies must be vigilant to detect the practice if it occurs and take necessary corrective action.

[To monitor sales chasing] A preferred approach is to use only sales that occur after appraised values are determined. However, as long as values from the most recent appraisal year are used in ratio studies, this is likely to be impractical. A second approach is to use values from the previous assessment year, so that most (or all) sales in the study follow the date values were set. In this approach, measures of central tendency must be adjusted to reflect changes in value between the previous and current year. For example, assume that the measure of central tendency is 0.924 and, after excluding parcels with changes in use or physical characteristics, that the overall change in value between the previous and current assessment years is 6.3 percent. The adjusted measure of central tendency is $0.924 \times 1.063 = 0.982$. This approach can be effective in determining the level of appraisal, but measures of uniformity will be unreliable if there has been any meaningful reappraisal activity for the current year.

Gloudemans, Robert J., Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 315.

III. Analysis of the Preliminary, Trended Preliminary and R&O Median Ratio Continued

	Preliminary Median	% Change in Assessed Value (excl. growth)	Trended Preliminary Ratio	R&O Median
2009	66	10.88	73	71
2008	60.57	16.10	70	72.57
2007	71	5.29	74	73
2006	75	0.53	75	75
2005	77	0.03	77	77

AGRICULTURAL UNIMPROVED: The relationship between the trended preliminary ratio and the R&O median ratio suggests the valuation process is applied to the sales file and assessed population in a similar manner. The county has a strong recent history of very similar changes in the two statistics that are recorded in this table. That suggests a pattern of good assessment practices is ongoing in this property type. This table indicates that the statistics in the R&O can be relied on to measure the level of value for this class of property.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value

This section analyzes the percentage change of the assessed values in the sales file, between the 2009 Preliminary Statistical Reports and the 2009 R&O Statistical Reports, to the percentage change in the assessed value of all real property base, by class, reported in the 2008 County Abstract of Assessment for Real Property, Form 45, excluding growth valuation, compared to the 2008 Certificate of Taxes Levied (CTL) Report. For purposes of calculating the percentage change in the sales file, only the sales in the most recent year of the study period are used. If assessment practices treat sold and unsold properties consistently, the percentage change in the sales file and assessed base will be similar. The analysis of this data assists in determining if the statistical representations calculated from the sales file are an accurate measure of the population. The following is justification for such an analysis:

Comparison of Average Value Changes

If sold and unsold properties are similarly appraised, they should experience similar changes in value over time. Accordingly, it is possible to compute the average change in value over a selected period for sold and unsold parcels and, if necessary, test to determine whether observed differences are significant. If, for example, values for vacant sold parcels in an area have increased by 45 percent since the previous reappraisal, but values for vacant unsold parcels have increased only 10 percent, sold and unsold parcels appear to have not been equally appraised. This apparent disparity between the treatment of sold and unsold properties provides an initial indication of poor assessment practices and should trigger further inquiry into the reasons for the disparity.

IV. Analysis of Percentage Change in Total Assessed Value in the Sales File to Percentage Change in Assessed Value Continued

% Change in Total
Assessed Value in the Sales File

% Change in Total Assessed Value (excl. growth)

11.32	2009	10.88
20.50	2008	15.86
10.67	2007	5.29
0.00	2006	0.53
0.00	2005	0.03

AGRICULTURAL UNIMPROVED: The percent change in assessed value for both sold and unsold properties is very similar. Historically, the county has had a consistent relationship between these statistics. This indicates that the statistical calculations from either set of statistics are equally reliable as an accurate measure of the population.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization; to ensure proper funding distribution of aid to political subdivisions, particularly when the distribution in part is based on the assessable value in that political subdivision, Standard on Ratio Studies, International Association of Assessing Officers, (2007). The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

V. Analysis of the R&O Median, Wgt. Mean, and Mean Ratios Continued

	Median	Wgt. Mean	Mean
R&O Statistics	71	69	71

AGRICULTURAL UNIMPROVED: The three measures of central tendency all are within the acceptable range and relatively similar, suggesting the level of value for this class of property is within the acceptable range. The median is the measure of central tendency to be least influenced by outliers, and in this subclass, the most reliable indicator of the level of value.

VI. Analysis of R&O COD and PRD

In analyzing the statistical data of assessment quality, there are two measures primarily relied upon by assessment officials. The Coefficient of Dispersion, COD, is produced to measure assessment uniformity. A low COD tends to indicate good assessment uniformity as there is a smaller spread or dispersion of the ratios in the sales file. A COD of less than 15 suggests that there is good assessment uniformity. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 235-237. The IAAO has issued performance standards for major property groups:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

The Price Related Differential, PRD, is produced to measure assessment vertical uniformity (progressivity or regressivity). For example, assessments are considered regressive if high value properties are under-assessed relative to low value properties. A PRD of greater than 100 suggests that high value properties are relatively under-assessed. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), pp. 239-240. A PRD of less than 100 indicates that high value properties are relatively over-assessed. As a general rule, except for small samples, a PRD should range between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD. Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

The analysis in this section indicates whether the COD and PRD meet the performance standards described above.

	COD	PRD
R&O Statistics	16.01	103.57
Difference	0.00	0.57

AGRICULTURAL UNIMPROVED: The COD is in the range and the PRD is slightly out of the range. Analyzing the statistics for this class suggests that the assessment has been done uniformly and proportionately. In the current market cycle, the value of agricultural land has been increasing at unprecedented rates. Most of the higher ratios are among the older sales and the small dollar sales. Conversely many of the lower ratios occurred among the more recent sales. In the case of the valuation of agricultural land, the system of market analysis and value application is all done consistently within the agricultural classification structure.

VII. Analysis of Change in Statistics Due to Assessor Actions

This section compares the statistical indicators from the Preliminary Statistical Reports to the same statistical indicators from the R&O Statistical Reports. The analysis that follows explains the changes in the statistical indicators in consideration of the assessment actions taken by the county assessor.

	Preliminary Statistics	R&O Statistics	Change
Number of Sales	48	48	0
Median	66	71	5
Wgt. Mean	63	69	6
Mean	66	71	5
COD	17.11	16.01	-1.10
PRD	104.16	103.57	-0.59
Minimum	36.71	40.68	3.97
Maximum	93.16	102.11	8.95

AGRICULTURAL UNIMPROVED: The change between the preliminary statistics and the Reports and Opinion statistics is consistent with the assessment actions reported by the county for this class of property. The changes shown between the Preliminary Statistics and the Final R&O Statistics were all considered to be favorable ones and depict a sound assessment process.
