2008	190	98	98	
2007	244	98	98	

2011 Opinions of the Property Tax Administrator for Hall County

My opinions and recommendations are stated as a conclusion based on all of the factors known to me regarding the assessment practices and statistical analysis for this county. See, Neb. Rev. Stat. §77-5027 (R. S. Supp., 2005). While the median assessment sales ratio from the Qualified Statistical Reports for each class of real property is considered, my opinion of the level of value for a class of real property may be determined from other evidence contained within this Reports and Opinions of the Property Tax Administrator. My opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

Class	Level of Value	Quality of Assessment	Non-binding recommendation
Residential Real Property	94	Meets generally accepted mass appraisal practices.	No recommendation.
Commercial Real Property	95	Meets generally accepted mass appraisal practices.	No recommendation.
Agricultural Land	71	The qualitative measures calculated in the random include sample best reflect the dispersion of the assessed values within the population. The quality of assessment meets generally accepted mass appraisal practices.	No recommendation.

^{**}A level of value displayed as NEI, not enough information, represents a class of property with insufficient information to determine a level of value.

Dated this 11th day of April, 2011.

A. Residential Real Property

Hall County is located in south central Nebraska, about 10 miles north of Interstate 80. The largest city is Grand Island. The city of Grand Island is the major economic influence in the county and several of the smaller communities nearby could be termed "bedroom communities". Grand Island makes up one corner of the "Tri-Cities" along with Kearney and Hastings.

The statistical sampling of 1362 qualified residential sales will be considered an adequate and reliable sample for the measurement of the residential class of real property in Hall County. The measures of central tendency offer support for each other and all fall within the acceptable range. The qualitative measures are within the acceptable range. All valuation groupings are within or round to within the acceptable range.

Hall County has had in place a sales review process for many years. A sales verification questionnaire is sent to both the buyer and the seller of the property. The questionnaire asks for details to assist the assessor in discovering information about the terms of the sale. The document asks how the selling price was established, whether any personal property was involved in the sale, how the property was listed for sale, if there was any prior association between the buyer and the seller and if there was any special consideration involved in the sale. Occasionally phone calls will be made to other parties involved in the sale such as the seller, the title company or to the attorney involved in the sale. They estimate that they receive back information on approximately 65% of all questionnaires sent. The in-house appraisal staff physically reviews any sale with a perceived discrepancy.

Hall County employs an appraisal department consisting two full time appraisers. Hall County follows a routine cyclical physical inspection for reviewing the property in their county. Their review includes physically inspecting, measuring, photographing and updating their records. Hall County is committed to moving forward technologically. In 2010 they began the process of obtaining the Pictometry system for the County. The Assessor worked hard to coordinate with other county and city officials to share the cost of implementation. They also maintain their website with parcel search and utilize their GIS system.

Based on the consideration of all available information, the level of value is determined to be 94% of market value for the residential class of real property. Because the known assessment practices are reliable and consistent it is believed that the residential class of property is being treated in the most uniform and proportionate manner possible.

B. Analysis of Sales Verification

Neb. Rev. Stat. 77-1327(2) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2007), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Division frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The International Association of Assessing Officers recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard of Ratio Studies, adopted by the International Association of Assessing Officers,

July, 2007, recommends that the PRD should lie between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

2011 Commercial Assessment Actions for Hall County

Revalued multi-family parcels – raised by 10%

Revalued service repair parcels – raised by 30%

Revalued warehouse storage parcels – raised by 10%

Process all commercial pick up work and permit work

2011 Commercial Assessment Survey for Hall County

1.	Valuation data collection done by:	
	Contract and staff appraisers	
2.	List the valuation groupings used by the County and describe the uniq	ue
	characteristics that effect value:	
	<u>Valuation</u> <u>Description of unique characteristics</u>	
	Grouping	
	1 Grand Island, large city, 4 high schools, very active economic distric	t
	5 Villages, Alda, Cairo, Doniphan, Wood River	
	Rural – all commercial parcels not located inside a zoned city limt	
3.	List and describe the approach(es) used to estimate the market value	of
	commercial properties.	
	Cost and sales comparison and income, when information is available	
4.	When was the last lot value study completed?	
	2006	
5.	Describe the methodology used to determine the commercial lot values.	
	Depending on location, square footage or acres	
6.	What costing year for the cost approach is being used for each valuati	on
	grouping?	
	June 2005 Marshall-Swift	
7.	If the cost approach is used, does the County develop the depreciati	on
	study(ies) based on local market information or does the county use the tab	les
	provided by the CAMA vendor?	
	The county develops their own	
8.	Are individual depreciation tables developed for each valuation grouping?	
	No	
9.	How often does the County update the depreciation tables?	
	As needed	
10.	Is the valuation process (cost date and depreciation schedule or mark	et
	comparison) used for the pickup work the same as was used for the gener	al
	population of the class/valuation grouping?	
	Yes	
11.	Describe the method used to determine whether a sold parcel is substantia	lly
	changed.	
	If there have been significant additions, removal of improvements or remodeling	
12.	Please provide any documents related to the policies or procedures used for t commercial class of property.	he

A. Commerical Real Property

Hall County is located in south central Nebraska, about 10 miles north of Interstate 80. The largest city is Grand Island. The city of Grand Island is the major economic influence in the county and several of the smaller communities nearby could be termed "bedroom communities". Grand Island makes up one corner of the "Tri-Cities" along with Kearney and Hastings.

The statistical sampling of 157 qualified commercial sales will be considered an adequate and reliable sample for the measurement of the commercial class of real property in Hall County. The calculated median is 95%. All valuation groups and property types, with a reliable number of statistics, calculate to within the range. The qualitative statistics are above the range which is not unusual considering the diversity of the class. All occupancy codes with a reliable number of sales fall within the acceptable range.

Hall County has had in place a sales review process for many years. A sales verification questionnaire is sent to both the buyer and the seller of the property. The questionnaire asks for details to assist the assessor in discovering information about the terms of the sale. The document asks how the selling price was established, whether any personal property was involved in the sale, how the property was listed for sale, if there was any prior association between the buyer and the seller and if there was any special consideration involved in the sale. Occasionally phone calls will be made to other parties involved in the sale such as the seller, the title company or to the attorney involved in the sale. They estimate that they receive back information on approximately 65% of all questionnaires sent. The in-house appraisal staff physically reviews any sale with a perceived discrepancy.

Hall County employs an appraisal department consisting two full time appraisers. Hall County follows a routine cyclical physical inspection for reviewing the property in their county. Their review includes physically inspecting, measuring, photographing and updating their records. Hall County is committed to moving forward technologically. In 2010 they began the process of obtaining the Pictometry system for the County. The Assessor worked hard to coordinate with other county and city officials to share the cost of implementation. They also maintain their website with parcel search and utilize their GIS system.

Based on the consideration of all available information, the level of value is determined to be 95% of market value for the commercial class of real property. Because the known assessment practices are reliable and consistent it is believed that the commercial class of property is being treated in the most uniform and proportionate manner possible.

B. Analysis of Sales Verification

Neb. Rev. Stat. 77-1327(2) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2007), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Division frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The International Association of Assessing Officers recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard of Ratio Studies, adopted by the International Association of Assessing Officers,

July, 2007, recommends that the PRD should lie between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

2011 Agricultural Assessment Actions for Hall County

Merged market area 3 with market area 1

Increased irrigated values in market area 2 equal to market area 1

Increased dry crop values over entire county by 4%

Lowered the bottom four classes of grass from 680/acre to 625/acre

Established new residential and farm site values for parcels

Updated agricultural files with actual soils from latest soil survey (second phase of implementation)

Contracted with Stanard Appraisal to review and revalue all improvements (both residential and farm buildings) on all ag parcels

Processed all pick up work and improvement statement work

2011 Agricultural Assessment Survey for Hall County

1.	Valuation data collection done by:										
	Office Staff										
2.	List each mark	xet area, and describe the location and the specific characteristics									
	that make each	unique.									
	Market Area	Description of unique characteristics									
	1	North of the Platte River, no differences in value for 2011									
	2	South of the Platte River, no differences in value for 2011									
3.	Describe the pr	rocess that is used to determine and monitor market areas.									
	Review sales north or south of the Platte River for market differences, plot sales,										
	spreadsheet ana	lysis									
4.	Describe the p	process used to identify and value rural residential land and									
	recreational la	nd in the county.									
	Cost of raw lan	d for residential use plus cost of amentities (septic, well, elec) review									
	parcels on an in	dividual basis for determination of recreational use									
5.		sites carry the same value as rural residential home sites or are									
		nces recognized? If differences, what are the recognized market									
	differences?										
	Yes										
6.		racteristics are used to assign differences in assessed values?									
	Usage – crop land, grass, waste and or accretion										
7.	What process is used to annually update land use? (Physical inspection, FSA										
	maps, etc.)										
		County has used both physical inspection and FSA maps, they are in									
		btaining the Pictometry program and will use it's capabilities

A. Agricultural Land

Hall County is comprised of approximately 72% irrigated land, 7% dry crop land and 19% grass/pasture land. In the past, Hall County maintained three market areas, market area one was the majority of the county north of the Platte River, market area two was agricultural land south of the Platte River and market area three was an encapsulated area located within the Cornhusker Army Ammunition Plant. Historically, the dry and grass values were the same across all three market areas. For the 2011 assessment year, Hall County eliminated market area three and, after market analysis, determined that the irrigated land values should also be the same across the county. They kept the two market area designations in their computer system but for measurement purposes, Hall County will be measured as one market area.

Hall County has 70 qualified agricultural sales in the three year study period. The sales are not quite proportionately spread across the three years of the study period, there are 28 sales in the oldest year, 20 sales in the middle year and 22 sales in the newest year. The sales in appear to be representative of the county, with the sales file containing sales that are approximately 66% irrigated, 10% dry and 21% grass. The Base statistics show the calculated median to be 71%. Although the sales appear to be representative, there does not appear to be a proportionate distribution of sales across the three year time period. When reviewing the majority land usage, both the 95% and 80% MLU for irrigated and grass are within the range; there are not enough dry sales for a reliable statistical analysis.

The second test, random inclusion, added 1 sale to the middle year to meet an acceptable threshold. The sample now had a better distribution of sales across the three years and was still representative of the land in the county. The Random Inclusion statistics show the calculated median to be 71%. When reviewing the majority land usage, both the 95% and 80% MLU for irrigated and grass are within the range; there are not enough dry sales for a reliable statistical analysis.

The third test, random exclusion, was to bring in as many sales from a six mile radius as possible to maintain a proportionate and representative sample and to meet the 10% threshold between study years. From the neighboring counties, 68 sales were deemed comparable and brought in to the analysis; 26 sales in the oldest year, 25 in the middle year and 17 in the newest year. The sales file was not distorted with the inclusion of the sales, there is a proportionate distribution of sales among each year of the study period, the sample is considered adequate to be statistically reliable, and there continues to be a reasonable representation of the land use in Hall County. The random exclusion statistics show the calculated median to be 72%. A review of the majority land usage shows all classes calculate or round to within the range. Irrigated values were increased in some areas, dry values were increased 4% across the county and grass values were slightly decreased.

A review of the neighboring counties show that the 2011 values in Hall County appear to blend by class with their neighboring counties, especially Hamilton and Adams. All indications support that Hall County has achieved both inter- and intra-county equalization.

more proportionate distribution. Based on the consideration of all available information, the level of value is determined to be 71% of market value for the agricultural class of real property. Because the known assessment practices are reliable and consistent it is believed that the agricultural class of property is being treated in the most uniform and proportionate manner possible.

B. Analysis of Sales Verification

Neb. Rev. Stat. 77-1327(2) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2007), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Division frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The International Association of Assessing Officers recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard of Ratio Studies, adopted by the International Association of Assessing Officers,

July, 2007, recommends that the PRD should lie between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

2010 PLAN OF ASSESSMENT FOR HALL COUNTY ASSESSMENT YEARS 2011, 2012 AND 2013

REAL PROPERTY

There are several areas that are addressed on an annual basis and I do not foresee changing. These include conducting an unimproved ag land market analysis (plotting all vacant ag land sales and color coding them for level of assessment) and creating a color map to use as a visual aid, review statistical analysis of property types for problem areas, sending questionnaires to buyer/seller on recently sold properties, compiling sales books based on current sales, monitoring ag land sales to determine need for additional market areas and conducting pick-up work.

2011

During calendar year 2010, the Assessor's Office plans to accomplish the following:

- 1) Remap parcels for soil survey changes
- 2) Build new ag file in T2 TerraScan program for remapped parcels
- 3) Coordinate agland data received from Central Platte NRD after their irrigated land certification program
- 4) Complete driving last four sections in the South half of Hall County to verify land use
- 5) Map and recalculate parcels with appropriate land uses
- 6) Review valuations and assessment levels for problem areas and any necessary adjustments
- 7) Break out areas to be inspected for fourth year of six year cycle by neighborhood in City of Grand Island (these will be in addition to the areas reviewed for ag use)
- 8) Convert to T2 TerraScan program in November
- 9) Implement rectified acres on parcels after GPS program completed (determined by GIS Department)
- 10) Investigate possibility of using Pictometry Intelligent Images program
- 11) Begin verification work with GIS Department and address any problems discovered with soil survey and new conversion

2012

During calendar year 2011, the Assessor's Office plans to accomplish the following:

- 1) Review rural subs, homesites and outbuildings
- 2) Attempt to establish correlation process for the three approaches to value
- 3) Inspect Village properties in Hall County for fifth year of six year cycle
- 4) Continue reviewing neighborhoods in City of Grand Island for fifth year of six year cycle
- 5) Review valuations and assessment levels for problem areas and any necessary adjustments

2013

During calendar year 2012, the Assessor's Office plans to accomplish the following:

- 1) Establish valuation models for residential properties
- 2) Inspect mobile homes for sixth year of six year cycle
- 3) Continue reviewing neighborhoods in City of Grand Island for sixth year of six year cycle
- 4) Review valuations and assessment levels for problem areas and any necessary adjustments

The breakdown of value in Hall County for 2010 is approximately as follows:

Real Estate	90.90%
Personal Property	5.50%
Centrally Assessed	3.60%
•	100.00%

This breakdown supports the need to allocate the majority of resources (man-hours, technology and budget) on the real estate portion of the Assessor's office statutory duties.

2011 Assessment Survey for Hall County

A. Staffing and Funding Information

1.	Deputy(ies) on staff:
	1
2.	Appraiser(s) on staff:
3.	Other full-time employees:
	4
4.	Other part-time employees:
	0
5.	Number of shared employees:
	0
6.	Assessor's requested budget for current fiscal year:
	\$368,968.63
7.	Adopted budget, or granted budget if different from above:
	\$367,968.63
8.	Amount of the total budget set aside for appraisal work:
	Separate reappraisal budget
9.	Appraisal/Reappraisal budget, if not part of the total budget:
	\$60,413.57
10.	Part of the budget that is dedicated to the computer system:
	Hall County has a separate IT Department
11.	Amount of the total budget set aside for education/workshops:
	\$1,200
12.	Other miscellaneous funds:
	\$100 misc, \$300 safety
13.	Amount of last year's budget not used:
	\$1,500

B. Computer, Automation Information and GIS

1.	Administrative software:
	Terra Scan
2.	CAMA software:
	Terra Scan
3.	Are cadastral maps currently being used?
	Yes
4.	If so, who maintains the Cadastral Maps?
	Office Staff
5.	Does the county have GIS software?
	Yes

6.	Who maintains the GIS software and maps?
	GIS Department
7.	Personal Property software:
	Terra Scan

C. Zoning Information

1.	Does the county have zoning?
	Yes
2.	If so, is the zoning countywide?
	Yes
3.	What municipalities in the county are zoned?
	Alda, Cairo, Doniphan, Grand Island and Wood River
4.	When was zoning implemented?
	May 1942, updated in 1967

D. Contracted Services

1.	Appraisal Services:
	Stanard Appraisal Services, Inc. for commercial pick-up work or special projects
2.	Other services:
	The County Board contracts with Stanard Appraisal for protest hearings

2011 Certification for Hall County

This is to certify that the 2011 Reports and Opinions of the Property Tax Administrator have been sent to the following:

One copy by electronic transmission to the Tax Equalization and Review Commission.

One copy by electronic transmission to the Hall County Assessor.

Dated this 11th day of April, 2011.

PROPERTY TAX ADMINISTRATOR PROPERTY ASSISSING

Ruth A. Sorensen Property Tax Administrator

Ruth A. Sorensen
