2011 Opinions of the Property Tax Administrator for Sioux County

My opinions and recommendations are stated as a conclusion based on all of the factors known to me regarding the assessment practices and statistical analysis for this county. See, Neb. Rev. Stat. §77-5027 (R. S. Supp., 2005). While the median assessment sales ratio from the Qualified Statistical Reports for each class of real property is considered, my opinion of the level of value for a class of real property may be determined from other evidence contained within this Reports and Opinions of the Property Tax Administrator. My opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

Class	Level of Value	Quality of Assessment	Non-binding recommendation
Residential Real Property	96	Meets generally accepted mass appraisal practices.	No recommendation.
Commercial Real Property	*NEI	Does not meet generally accepted mass appraisal practices.	No recommendation.
Agricultural Land	73	The qualitative measures calculated in the base stat sample best reflect the dispersion of the assessed values within the population. The quality of assessment meets generally accepted mass appraisal practices.	No recommendation.

^{**}A level of value displayed as NEI, not enough information, represents a class of property with insufficient information to determine a level of value.

Dated this 11th day of April, 2011.

A. Residential Real Property

As shown in the Sioux County 2011 residential profile, there were only fourteen qualified residential sales occurring during the time period of the sales study. Two of the three overall measures of central tendency are within acceptable range (the median and the mean) and the weighted mean is approximately two points below the limit of acceptable range. The coefficient of dispersion is remarkably within range at 6.86 and perhaps reflects the assessment actions listed below. The price-related differential however is slightly more than two percentage points above its upper limit. Further analysis of the statistical profile reveals that neither valuation grouping exhibits a median or qualitative statistics outside of their prescribed parameters.

For 2011, the County completed the physical review of all residential improvements within the County, and re-valued these using a 2010 cost index. Coupled with this was the completion of a market-derived depreciation schedule.

Sioux County's sales qualification and review process consists of a questionnaire mailed to buyers of all residential, commercial and agricultural property on a quarterly basis. It is estimated that about one-half of the questionnaires are returned. For those not returned within a month of the mailing, another questionnaire is sent (again to the buyer). The Assessor utilizes the information collected from the questionnaires, as well as her personal knowledge of the County to enhance the qualification and review process.

In consideration of the above mentioned data, it is determined that the overall residential level of value is 96% of actual market value. Based upon knowledge of the County's assessment practices, and the recent completion of a county-wide improvement revaluation, it is believed that residential property within Sioux County is treated both uniformly and proportionately.

B. Analysis of Sales Verification

Neb. Rev. Stat. 77-1327(2) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2007), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Division frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The International Association of Assessing Officers recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard of Ratio Studies, adopted by the International Association of Assessing Officers,

July, 2007, recommends that the PRD should lie between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

2011 Commercial Assessment Actions for Sioux County

For 2011, the County completed the physical review of all commercial improvements within the County, and re-valued these using a 2010 cost index. Coupled with this was the completion of a market-derived depreciation schedule.

2011 Commercial Assessment Survey for Sioux County

1.	Valuation d	lata collection done by:

A. Commerical Real Property

As shown by the Sioux County 2011 commercial statistical profile, only three qualified commercial sales occurred during the timeframe of the commercial sales study, and this indicates that there is not a viable, competitive commercial market in this agricultural-based County.

Due to the lack of any statistically significant sales data, it is believed that neither the level of value nor quality of assessment can be determined for the Sioux County commercial property class.

B. Analysis of Sales Verification

Neb. Rev. Stat. 77-1327(2) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2007), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Division frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The International Association of Assessing Officers recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard of Ratio Studies, adopted by the International Association of Assessing Officers,

July, 2007, recommends that the PRD should lie between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

2011 Agricultural Assessment Actions for Sioux County

For 2011, the County completed the physical review of all agricultural improvements within the County, and re-valued these using a 2010 cost index. Coupled with this was the completion of a market-derived depreciation schedule.

Any land class or subclass found outside of acceptable range was adjusted. For example, all irrigated land in agricultural market area one was raised (with the exception of subclass 1A). Two subclasses of dry were raised (2D1 and 2D), and three subclasses of grass received raises (3G1, 3G and 4G1). For agricultural market area two three irrigated classes were raised to closer match the market (1A, 2A1 and 2A) and the three lowest irrigated subclasses were lowered in value (3A, 4A1 and 4A). Dry land remained the same, and the top four subclasses of grass were raised, while the bottom three subclasses were lowered.

A. Agricultural Land

There is a total of 2067 square miles of land within Sioux County, and agricultural land consists approximately of 89% grass, 3% dry land and about 4% irrigated. The remaining four percent is classified as waste. The County currently has two clearly defined agricultural market areas based on topography, soil type and availability of water. Market area one is the largest area in the County and consists mostly of grass land. Market area two on the southwestern end of the County has irrigated farm ground and borders Scotts Bluff County on the south and the State of Wyoming to the west. Other counties contiguous to Sioux are Dawes and Box Butte to the east. All of the neighboring counties have multiple market areas.

Sales verification and qualification within Sioux County consists of a questionnaire mailed to buyers of all residential, commercial and agricultural property on a quarterly basis. It is estimated that about one-half of the questionnaires are returned. For those not returned within a month of the mailing, another questionnaire is sent (again to the buyer). The Assessor utilizes the information collected from the questionnaires, as well as her personal knowledge of the County to enhance the qualification and review process.

For 2011, the County completed the physical review of all agricultural improvements within the County, and re-valued these using a 2010 cost index. Coupled with this was the completion of a market-derived depreciation schedule. Any land class or subclass found outside of acceptable range was adjusted. For example, all irrigated land in agricultural market area one was raised (with the exception of subclass 1A). Two subclasses of dry were raised (2D1 and 2D), and three subclasses of grass received raises (3G1, 3G and 4G1). For agricultural market area two three irrigated classes were raised to closer match the market (1A, 2A1 and 2A) and the three lowest irrigated subclasses were lowered in value (3A, 4A1 and 4A). Dry land remained the same, and the top four subclasses of grass were raised, while the bottom three subclasses were lowered.

The agricultural Base Stat profile reveals that for the three-year timeframe of the sales study, there were thirty-two sales deemed qualified by the Assessor. Of these, nine occurred during July 1, 2007 to June 30, 2008, nine also occurred during the second study year from July 1, 2008 to June 30, 2009, and fourteen sales occurred during the latest study year from July 1, 2009 to June 30, 2010. The sample appears to be over-represented for the latest year of the study period, based on the Department policy of a minimum threshold of 10% variance of total sales per year. This can be further shown by market area. Market area one has a total of twenty-five sales, with five occurring in the first year, eight in the second and twelve in the third. Market area two indicates seven total sales with four occurring in the first year, only one in the second and two in the third. Therefore, market area one appears to be over-represented in the latest year in the sales study period. Market area two is over-represented in the earliest year in the sales study period. Examination of the sample land use (for the whole County, rather than by market area) is approximately 85% grass, 5% dry and 6% irrigated. Comparison of the sample land use to the actual land percentages of the County reveals there is less than 10% difference in the sample for all three land classes, and appears representative for land use.

To arrive at the level of value and quality of assessment for agricultural land within Sioux County, three statistical tests were utilized: the first test, named Base Stat, consists of the statistical profile using only the sales that occurred during the timeframe of the sales study within Sioux County. Test two, named Random Include, consists of the County sales and a random inclusion of comparable sales (similar soils, land use, topography), from contiguous counties to eliminate the time bias in both agricultural market areas. There were twenty-nine total comparable sales from all of the counties bordering Sioux, and of these for market area one, four were randomly drawn for the first year (7.01.07 to 6.30.08) and one was randomly drawn for the second year (7.01.08 to 6.30.09) of the sales study. In market area two, two sales were randomly drawn that occurred in the second year, and two were drawn that occurred in the third. This produced a total of forty-one sales with 13 sales in the first year (overall), 12 in the second, and sixteen in the third. Thus, the minimum threshold of 10% variance of total sales per year as set in Department policy was met.

Test three, named Random Exclude, and consists of including all comparable sales and then randomly excluding these to obtain a proportionate sample and to eliminate time bias caused by more than 10% variance of total sales per year. In market area one, four were randomly drawn for the first year, and two were randomly drawn for the second year. In market area two, three sales were randomly drawn that occurred in the second year, and two were drawn that occurred in the third. The result was a total of forty-three sales, with 13 in the first year, 14 in the second and 16 in the third.

A review of the statistical data from all three tests reveals two calculated medians of 73% (rounded Base Stat and Random Include), and a calculated median of 74% (Random Exclude) with coefficients of dispersion that would support these. All three tests indicate that the median measurements for both agricultural market areas are within acceptable range. A review of Majority Land Use >95% appears to indicate that grass is above the acceptable range. However, nineteen of the twenty-five sales of MLU >95% (in area one) are a mixture of at least MLU >80% grass and miss the MLU>95% mark only due to other classifications as part of the individual sale's land mix (sometimes by small percentages): timber, shelterbelt, and waste. These sales probably represent the way grass land is actually purchased within the market and represent the actual market for grass within area one. Further, an examination of the Majority Land Use >80% indicates the following medians for grass in all three tests: Base Stat: 20 sales at 74.48%; Random Include: 22 sales at 74.48%; Random Exclude: 23 sales at 75.29%. Since all three statistical tests indicate a calculated level of value of grass within range at MLU >80%, but not at MLU >95%, there will be no non-binding recommendation made for the grass subclass.

All three tests reveal a median that is within acceptable range, and to a large extent support the level of value measurement of each other. It is my opinion, based on consideration of all the information available to me that the level of value of agricultural land in Sioux County is 73%. Further, with knowledge of the County's assessment practices it is believed that agricultural land is being assessed uniformly and proportionately.

B. Analysis of Sales Verification

Neb. Rev. Stat. 77-1327(2) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2007), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Division frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness in the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The IAAO considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The International Association of Assessing Officers recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard of Ratio Studies, adopted by the International Association of Assessing Officers,

July, 2007, recommends that the PRD should lie between 98 and 103. This range is centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 247.

SIOUX COUNTY, NEBRASKA THREE-YEAR ASSESSMENT PLAN (JUNE 2010)

To: Sioux County Board of Commissioners

Ruth Sorensen, Nebraska Property Tax Administrator

FROM: Michelle Zimmerman, Sioux County Assessor

Pursuant to Neb. Rev. Stat. 77-1311(9), Sioux County Assessor Michelle Zimmerman hereby presents a Three-year Assessment Plan as follows:

Sioux County, Nebraska, lying in the extreme northwest corner of Nebraska, is 69 miles long and averages 29 miles in width, containing an area of 2,055 square miles. Real property in Sioux County is comprised of 4,269 parcels broken down into 349 residential properties, 64 commercial properties, 38 recreational, and a total of 3,814 ag parcels (3,157 unimproved and 657 improved). There are 84 tax exempt parcels, which constitutes approximately 10% of the ag land in Sioux County. Sioux County had 360 personal property schedules filed on May 1, 2010. The total valuation of personal property increased by over \$1,118,000.00 due to the staff member's diligence in requiring depreciation schedules for each return. I was appointed Sioux County Clerk, Ex-Officio Assessor in April of 2009, and have had the opportunity to restructure the staff in the assessor's office to one full-time employee who pays particular attention to detail. I have spent this past year working to familiarize myself with all aspects of the assessor's office. I and my one staff member have been able to correct some issues from the past and will continue to inspect each property record card for errors. There were 46 Homestead exemption applications filed for 2010.

The Sioux County Office Procedures Manual that was used by the former assessor is very outdated, with the changes in the GIS mapping and software programs. It is in my plan to develop a new manual over the course of the next year.

Sioux County has contracted with Stanard Appraisals to perform a complete reappraisal of the county. As of June 1, 2010, they are scheduled to begin their collection of data within the next week. The last reappraisal was completed in 1998, and with the resignation of the previous assessor, and my subsequent appointment, I am anxious to have everything updated before the end of calendar year 2010. All buildings will be on the tax roll, and I and my staff will perform all pick-up work after the reappraisal is completed. The assessor plans to choose 1/6 of the county each year to concentrate on beginning in the southern part of the county, as that is where the bulk of the population is and where most changes occur.

The total real property valuation for Sioux County for 2010 is 317,787,503, up from 315,117,550 in 2009. This is an increase of 2,669,953. The year 2010 again resulted in adjustments to ag land in Sioux County. The biggest percentage of changes occurred in Market Area 2 with all irrigated acres being increased. There had not been an increase since 2007 to irrigated acres, and the sales showed that higher prices had been paid for

land with irrigation. The timber subclass in Market Area 1 was lowered from \$360 to \$300 per acre. The Assessor feels that there have not been sufficient sales in the timber during the past several years to warrant a \$360.00 per acre value. Also, the protests that were heard last year were from ranchers with timber who stated that their cattle are not utilizing the timber now any more than they were several years ago when the values for timber was significantly less than grass. Market Area 1 experienced valuation decreases in some classes of grassland with the highest valuation being \$230.00 per acre.

Property record cards are maintained by me and my staff. The record owner name and mailing addresses are updated from 521's. The valuation information is updated annually. Pictures from the aerial photos that were taken in 2007 have been included in the property record cards as we update them with values for 2010. Maps are also updated from deeds that are recorded.

I, as Sioux County Assessor file all reports, Abstract, Certification of Values, School District Taxable Value, CTL, Tax List Corrections, and I also generate and deliver the tax roll to the County Treasurer.

Sioux County has county-wide zoning and requires building permits for residential construction and Improvement Information Statements for all ag construction other than residential buildings. I will utilize these forms to locate new construction. New improvements are physically inspected and added to the tax rolls annually. Data is collected by me and my office staff and all improvements are costed using Marshall Swift pricing. New photos are taken with the digital camera and they are entered in the CAMA system. New sketches are also drawn. The new County Solutions program that the previous Assessor had begun entering all rural residential data into, is being replaced by a new CAMA system, which is scheduled to be up and running in mid-July. The previous program was not user-friendly, had many glitches that MIPS was not aware of, and I am anxious to get training on the new program.

A sales data sheet is mailed to all purchasers listed on Form 521 Real Estate Transfer Statements on a quarterly basis, and I utilize the data collected to supplement Form 521 data. The data sheets are mailed out again to any purchaser's who have not returned the original form. The Assessor's personal knowledge is used for transactions when no response is returned concerning the sale. This is one of the advantages of a small county. The Form 521's and corresponding deeds provide the initial sales information for all real property transfers occurring within Sioux County and begins the process of analyzing the transfer of real property for each assessment year and sales study period.

I, as Sioux County Assessor, file all Form 521 Real Estate Transfer Statements and accompanying documentation, coding each sale for usability. I also review each sales roster and make all corrections. The Sioux County sales rosters for all three classes of property are carefully monitored for accuracy and completeness to reflect the taxable value of each item of real property.

Once I collect and analyze all available data for each sale and develop a sales ratio study, values are adjusted to reflect current market value for each subclass, and those values are applied to achieve the required levels of value and quality of assessment

I, as Sioux County Assessor, also compare the value of each subclass with the annual values established by Scottsbluff, Dawes and Box Butte counties which border Sioux County to assure that taxpayers paying taxes to political subdivisions that cross county lines are accurately and fairly assessed.

I will consider the use of Special Value Applications for those taxpayers affected by the use of recreational lands in the Pine Ridge area of Sioux County. If there is a differentiation between special value and the ag land values in the areas that are affected, greenbelt use will be implemented.

After values are established and implemented as indicated by the annual sales study, Reports and Opinions are issued by the Property Tax Administrator, and TERC takes action, I send out valuation change notices and begin updating records. A complete record is established for each parcel every year. I constantly monitor values and assess property in Sioux County, assuring county-wide equalization.

The focus for the upcoming year will be to concentrate on the sales study and collecting all available data that influences sales of ag lands in the county. I will also use the county-wide reappraisal as an opportunity to completely update all properties in Sioux County.

I, as Sioux County Assessor, will continue to maintain acceptable levels and quality of assessment throughout the county.

2011 Assessment Survey for Sioux County

A. Staffing and Funding Information

1.	Deputy(ies) on staff:
	One
2.	Appraiser(s) on staff:
	None
3.	Other full-time employees:
	One
4.	Other part-time employees:
	None
5.	Number of shared employees:
	One
6.	Assessor's requested budget for current fiscal year:
	\$171,651.24
7.	Adopted budget, or granted budget if different from above:
	\$171,651.24
8.	Amount of the total budget set aside for appraisal work:
	\$ 70,000
9.	Appraisal/Reappraisal budget, if not part of the total budget:
	N/A
10.	Part of the budget that is dedicated to the computer system:
	\$ 10,000
11.	Amount of the total budget set aside for education/workshops:
	\$ 4,800
12.	Other miscellaneous funds:
	None
13.	Amount of last year's budget not used:
	None

B. Computer, Automation Information and GIS

1.	Administrative software:
	MIPS/PC Admin.
2.	CAMA software:
	MIPS
3.	Are cadastral maps currently being used?
	Yes
4.	If so, who maintains the Cadastral Maps?
	The Assessor.
5.	Does the county have GIS software?
	Yes

6.	Who maintains the GIS software and maps?
	GIS Workshop
7.	Personal Property software:
	MIPS

C. Zoning Information

1.	Does the county have zoning?
	Yes
2.	If so, is the zoning countywide?
	Yes
3.	What municipalities in the county are zoned?
	Harrison
4.	When was zoning implemented?
	2001

D. Contracted Services

1.	Appraisal Services:
	Stanard Appraisal has been contracted to complete the reappraisal of all
	improvements within the County.
2.	Other services:
	MIPS/County Solutions for all administrative, CAMA, and personal property
	software; GIS WorkShop for GIS software.

2011 Certification for Sioux County

This is to certify that the 2011 Reports and Opinions of the Property Tax Administrator have been sent to the following:

One copy by electronic transmission to the Tax Equalization and Review Commission.

One copy by electronic transmission to the Sioux County Assessor.

Dated this 11th day of April, 2011.

PROPERTY TAX ADMINISTRATOR ADMINISTRATOR SERVICE PROPERTY ASSISTANT

Ruth A. Sorensen Property Tax Administrator
