2012 Opinions of the Property Tax Administrator for Box Butte County

My opinions and recommendations are stated as a conclusion based on all of the factors known to me regarding the assessment practices and statistical analysis for this county. See, Neb. Rev. Stat. § 77-5027 (2011). While the median assessment sales ratio from the Qualified Statistical Reports for each class of real property is considered, my opinion of the level of value for a class of real property may be determined from other evidence contained within these Reports and Opinions of the Property Tax Administrator. My opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

Class	Level of Value	Quality of Assessment	Non-binding recommendation	
Residential Real Property	96	Meets generally accepted mass appraisal practices.	No recommendation.	
Commercial Real Property	93	Meets generally accepted mass appraisal practices.	No recommendation.	
Agricultural Land 72		Meets generally accepted mass appraisal practices.	No recommendation.	

^{**}A level of value displayed as NEI (not enough information) represents a class of property with insufficient information to determine a level of value.

Dated this 9th day of April, 2012.

A. Residential Real Property

As the above 2012 residential improved statistical profile reveals, there were 177 residential sales deemed qualified by the Assessor that occurred during the two-year timeframe of the sales study period. All three measures of central tendency are within acceptable range with the median at 96%, the weighted mean at 95% and the mean at 97%, and any could be used to function as the point estimate for the overall residential level of value (LOV). The Coefficient of Dispersion is less than one point above its prescribed range (at 15.57), but the price-related differential is within acceptable range at 101.83. Further, the 95% Median Confidence interval is narrow (6.29 points) and the bounds are within range. Both the tight confidence interval and the reasonable COD support the median measure of central tendency. No Valuation Grouping with a significant number of sales exhibits a median outside of the prescribed range for level of value.

The process of sales verification and qualification within Box Butte County consists of a mailed questionnaire sent to both the buyer and seller of all sales transactions for all three property classes excepting only those that current IAAO standards recommend for possible exclusion. The Assessor estimates response at approximately one-half. Non-respondents are sent a second document and this appears to raise the response rate to about seventy-five percent. If no response is provided after the second mailing, it is Assessor's policy to automatically qualify those sales, with the provision that if it is later discovered that the sale is not truly arms'-length, it is then disqualified. Copies of returned questionnaires are attached to the Assessor's copy of the Real Estate Transfer statement F521, and kept in notebooks by sale year.

For assessment year 2012 the County completed residential pick-up work and continues with the physical review of Alliance residential to be completed in assessment year 2013.

Considering all of the above information, the overall residential level of value is determined to be 96%. Since the COD is less than one point above the recommended upper limit and the PRD is within its prescribed range, it is believed that these meet generally accepted mass appraisal practices. This is confirmed by the known assessment practices of the County in the conduct of sales verification, and review--these are consistent, and therefore the residential property class overall is believed to be treated in a uniform and proportionate manner.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

2012 Commercial Assessment Actions for Box Butte County

Commercial pick-up work was completed, and the on-going process of Alliance commercial review is continuing with the estimated completion date of 2013. In order to address specific valuation groupings that were outside of acceptable range, the Assessor made the following percentage adjustments: Hemingford commercial improvements only (within the Original Town area) were raised five-percent to bring these closer to market value. Alliance commercial improvements were increased by eight-percent to bring these closer to current market value.

A. Commercial Real Property

There were twenty-one improved commercial sales that were determined to be qualified by the Assessor during the three-year timeframe of the sales study period (7.01.08 to 6.30.11). Of these twenty-one sales, eighteen occurred in Valuation Grouping 10 (Alliance) and the remaining three are from Valuation Grouping 20 (Hemingford). The largest Occupancy Code group contains four sales and is coded 344 (office building). Two of the twenty-one sales are mobile home parks (and are occupancy code "Blank"). The overall statistical profile indicates that two of the three measures of central tendency are within acceptable range: a median of 93% and a mean of 95% (the third measure, the weighted mean is at 75%). Further review of the overall statistical profile reveals that one of the qualitative statistical measures is within its prescribed limits--a COD of 20.10. The Price-Related Differential is significantly above the upper limit (103) of its acceptable range at 127.03. It should be noted, that if the highest dollar sale was hypothetically removed (book 98, page 234 that sold for \$1.6 million), the PRD would fall to 105.82.

Box Butte County's sales qualification procedures for commercial property are as follows: a questionnaire is sent via mail to both the buyer and seller of commercial property (excepting only those that IAAO standards currently recommend for exclusion). If no response occurs after two mailings of the questionnaire, the Assessor's policy is to automatically qualify these, with the note that if in the future, it is discovered that the sale is not truly arms'-length, it then is disqualified. Copies of returned questionnaires are attached to the Assessor's copy of the Real Estate Transfer document F521, and kept in notebooks by year.

Regarding the six-year inspection cycle, Box Butte County has completed the physical review of Valuation Groupings 20 (Hemingford) and 80 (Rural) commercial. Valuation Grouping 10 (Alliance) must still be completed, and the task is currently in process. The estimated completion date of the review is assessment year 2013. For assessment year 2012, in order to address specific valuation groupings that were outside of acceptable range, the Assessor made the following percentage adjustments: Hemingford commercial improvements only (within the Original Town area) were raised five-percent to bring these closer to market value. Alliance commercial improvements were increased by eight-percent to bring these closer to current market value.

A review of the County's assessment practices appear to be consistent and it is believed there is uniform and proportionate treatment of all commercial property within the County. Therefore, it is believed that the overall median at 93% can be used to describe the level of value for the commercial property class. The qualitative statistics are deemed to meet generally accepted mass appraisal practices, since the COD is within its prescribed range, and the hypothetical removal of the highest dollar sale would move the PRD within less than three points of its prescribed parameters.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

2012 Agricultural Assessment Actions for Box Butte County

For assessment year 2012, the Box Butte County Assessor reviewed the agricultural market areas, the data of the three-year sales study period, and made the following changes:

In Market Area 1, all irrigated land capability groups were raised, and the four lower grass LCG's were lowered, in order to closer reflect 75% of the market.

All irrigated and dry land subclasses were raised in agricultural Market Area 2.

Agricultural Market Area 3 received increases to all but two of the irrigated Land Capability Groups (the exceptions were 2A1 and 2A). All dry land LCG's were raised, as well as the four lowest grass land subclasses.

^{*}Land capability grouping averages calculated using data reported on the 2012 Form 45, Abstract of Assessment

A. Agricultural Land

Box Butte County has a total of 1,078 square miles of land, and agricultural land consists of approximately 47% grass 29% dry land and about 23% irrigated. The remaining one percent is classified as waste and other. The County currently has three clearly defined agricultural market areas based on topography, soil type and availability of water. Agricultural Market Area One land is primarily in the southern part of the County that is mostly sandhills and the majority use of the land is grass for grazing cattle. Market Area Two agricultural land is located in the central portion of the County that has richer soils and a fairly level to slightly Agricultural Market Area Three has more rolling to steep hilly land, and rolling topography. irrigation wells found in this northern area are necessarily deeper than those in Market Area 2. Box Butte County lies within the Upper Niobrara White NRD. "In 2003, the UNWNRD [Upper Niobrara White NRD] established a stay on new high capacity wells to prevent the over-appropriation of the water supply. Working with Nebraska Department of Natural Resources (DNR), the UNWNRD strives to maintain a balance of supply and demand for ground and surface water. Currently, DNR has determined that the majority of the UNWNRD is fully appropriated. Fully appropriated means the balance between the water supply and demand has been reached...no new high capacity wells or surface water rights are allowed in this area" (taken from the UNWNRD website).

Counties contiguous to Box Butte are Dawes to the north, Sheridan to the east, Morrill to the south (with a small portion of Scotts Bluff on the southwest), and Sioux to the west. Of the neighboring counties, only Sheridan lacks defined agricultural market areas.

Sales verification and qualification within Box Butte County consists of a mailed questionnaire sent to both the buyer and seller of all sales transactions for all three property classes (excepting only those that current IAAO standards recommend for possible exclusion). The response rate is estimated at approximately one-half. Non-respondents are sent a second document and this appears to raise the response rate to about seventy-five percent. If no response occurs, the Assessor's policy is to automatically qualify these, with the note that if in the future, it is discovered that the sale is not truly armslength, it then is disqualified. Copies of returned questionnaires are attached to the Assessor's copy of the Real Estate Transfer document (F521), and kept in notebooks by year.

Preliminary analysis indicated that there was time non-proportionality countywide and by agricultural market area. The preliminary sample contained fifty-six sales with the following composition: Area One contained ten sales--three in the first year, two in the second and five in the third. Area Two's sales were comprised of seven in the first year of the study period, nine in the second and fifteen in the third. The fifteen sales that constitute Area Three had three sales in the first year, and six sales in each of the remaining two years. Further analysis also revealed that there was absolutely no feasible way that time uniformity and MLU uniformity (not only for the entire county, but for the individual market areas) were going to be obtained by merely identifying and borrowing comparable sales. Only Area Three may obtain both time and MLU balance by using comparable sales. There were simply not enough comparable sales from contiguous counties that fit both the time and MLU needs for Market Areas One and Two.

Therefore, only three comparable sales were identified that could be utilized: one for Area One and two for Area Three. Since the 10% minimum threshold of variance of total sales per year as part of Department policy could not be met in Areas One and Two, five Box Butte County sales were randomly eliminated from the third year of the study period in Market Area Two. This action left seven sales in the first year, nine in the second and ten in the third (keeping the 10% variance threshold). Since the Area One sample was over-represented by grass (74% versus 17%) for the area base, no comparable sales occurring in the second year of the study could be used (all four were predominantly grass). The comparable sale included in the Area One sample was all irrigated. However, representativeness by Majority Land Use was still not obtained for the County overall, or by Market Areas One and Two. The inclusion of the other two comparable sales produced both time and Majority Land Use balance only for Market Area Three.

For assessment year 2012, the Box Butte County Assessor reviewed the agricultural market areas, the data of the three-year sales study period, and made the following changes: in Market Area One, all irrigated Land Capability Groups were raised, and the four lower grass LCG's were lowered, in order to closer reflect 75% of the market. All irrigated and dry land subclasses were raised in agricultural Market Area Two. Agricultural Market Area Three received increases to all but two of the irrigated Land Capability Groups (the exceptions were 2A1 and 2A). All dry land LCG's were raised, as well as the four lowest grass land subclasses.

The resulting statistical profile indicates fifty-four sales with a median of 72%, a weighted mean of 71% and a mean of 73%. The overall COD is 18.39 and the PRD is at 103.17. All three overall measures are within acceptable range and any could act as the point estimate of the level of value for agricultural land in Box Butte County. The 95% Median Confidence Interval is rather narrow at 7.84 (74.61 - 66.77), and tends to confirm the median. Both qualitative statistics are within their prescribed parameters, and indicate overall assessment uniformity and proportionality.

Since only agricultural Market Area Three is representative for both time and Majority Land Use, an individual analysis of the other two market areas (One and Two) would be statistically inappropriate. The statistical analysis of Area Three reveals a median of 71%, a mean of 73% and a weighted mean of 67%. The Coefficient of Dispersion is at 15.81 and the Price-Related Differential is 109.07. Two of the three measures of central tendency are within acceptable range, and only the COD is within its prescribed parameters.

Based on the review of all available information, it is determined that the level of value for agricultural land in Box Butte County is 72%, and the qualitative statistical measures meet generally accepted mass appraisal standards.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

2011 BOX BUTTE COUNTY THREE YEAR PLAN OF ASSESSMENT

Requirement

The assessor shall prepare a plan of assessment, pursuant to Neb. Laws 2005, LB 263 Section 9, on or before June 15 each year. The assessor shall present the plan to the county board of equalization on or before July 31 each year. A copy of the plan and any amendments made shall be sent to the Department of Revenue Property Assessment Division on or before October 31 each year.

General Description of Real Property in Box Butte County

Per 2011 County Abstract, Box Butte County consists of the following real property types:

	Parcels	% of Total	% of Taxable Value
Residential	4,487	55	38.84
Commercial	800	10	12.03
Industrial	6	<1	1.49
Recreational	2	<1	0
Agricultural	2,803	35	47.64
Totals	8,098	100	100

Current Resources

- Staff *
 - Assessor with current certification and hours of continuing education
 - Deputy with current certification and hours of continuing education
 - Two full-time clerical employees
 - Hired appraiser from Stanard Appraisal
 - Our lister is employed by Stanard Appraisal
 - Part-time, local
- Budget
 - Our fiscal year is July 1-June 30 each year
 - The adopted budget for 2010-2011 yr was \$234,380
 - \$65,000 was budgeted for reappraisal
 - ◆ A resolution was passed to add \$25,000 to reappraisal
 - ◆ The \$65,000 was spent by April
 - \$2,000 was budgeted for pick up work
 - Pick up work was completed by Assessor and staff
 - ♦ Budgeted amount was used up for TERC prep fees

- The adopted budget for 2011-2012 is \$234,550
 - \$65,000 is budgeted for reappraisal
 - ◆ Alliance reappraisal cannot be completed for 2013 with the budgeted amount
 - \$5,000 is budgeted for pickup work and TERC prep

Equipment

- Leased CAMA program with Terra Scan
- Deed plotter (1998 version) software program
- Microsoft Windows Server 2003
- Internet access with local provider
- Four workstations
- Cadastral books maintained monthly with real estate transfers
- GIS contracted with GIS Workshop, Inc.

Current Assessment Procedures

- Update ownership by receipt of real estate transfers from register of deeds office
- Maintain sales file with monthly qualified sales
 - Conduct sales study
- Receive building permits monthly from the City's Building and Zoning office
 - Review properties as "pick-up" work annually
- Zoning is county wide, however the county does not enforce building permits for rural improvements
 - Our pick-up work for rural is currently by discovery
 - The Assessor's office promotes rural property owners to complete an Information Statement Form in the office
- Data collection is constant
 - Application for value change from discovery is applied annually between January 1 and March 19 each year
- Approaches to value are used in accordance with IAAO mass appraisal techniques
 - Income approach is applied to Alliance commercial properties (due to cycle of reappraisal)
 - Collected income and expense data
 - Analyzed data with market depreciation
 - Cost approach is used for all improved parcels
 - Marshall & Swift pricing system is used
 - Market depreciation applied
 - Market approach is used on all properties in regard to market depreciation

- Agricultural land sales are studied and valuations adjusted accordingly in their respective market areas
 - Agricultural land has three market areas
- Change of value notices are sent pursuant state statute 77-1315
- Levels of value are published in local newspapers and delivered to local radio station pursuant state statute 77-1315

Level of Value, Quality, and Uniformity for 2011 Assessment

	Median	COD	PRD
Residential	96%	18.52	106.36
Commercial	93%	18.99	96.60
Agricultural land	70%	27.14	117.88

Assessment Actions Planned for Assessment Year 2012

- Residential
 - Alliance
 - Continuing residential reappraisal
 - Make individual adjustments to properties via building permits if applied after data collector has reviewed
 - Hemingford
 - Study sales and adjust subclasses accordingly if needed
 - Inspect properties according to building permits and through discovery
 - Rural Residential
 - Enforce use of Improvement Information Statement in lieu of a building permit
 - Study sales and adjust values accordingly
- Commercial
 - Alliance
 - Inspect properties according to building permits and through discovery
 - Study sales and adjust values accordingly
 - Hemingford
 - Study sales and adjust values accordingly
 - Inspect properties according to building permits and through discovery
 - Rural
 - Enforce use of Improvement Information Statement in lieu of a building permit
 - Study sales and adjust values accordingly

- Agricultural land
 - Study sales and make adjustments if necessary
 - GIS land use is complete until next update of fly-over

Assessment Actions Planned for Assessment Year 2013

- Residential
 - Alliance
 - Complete residential reappraisal and apply market depreciation with new cost index
 - Study sales and adjust subclasses accordingly
 - Inspect properties according to building permits and through discovery
 - Hemingford
 - Inspect properties according to building permits and through discovery
 - Study sales and adjust accordingly
 - Rural Residential
 - Inspect properties through Improvement Information Statement and through discovery
 - Study sales and make adjustments if necessary

Commercial

- Alliance
 - Anticipate moving on for final phase of six year review
- Hemingford, and Rural
