Opinions

2012 Opinions of the Property Tax Administrator for Gage County

My opinions and recommendations are stated as a conclusion based on all of the factors known to me regarding the assessment practices and statistical analysis for this county. See, Neb. Rev. Stat. § 77-5027 (2011). While the median assessment sales ratio from the Qualified Statistical Reports for each class of real property is considered, my opinion of the level of value for a class of real property may be determined from other evidence contained within these Reports and Opinions of the Property Tax Administrator. My opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

| Class | Level of Value | Quality of Assessment | Non-binding recommendation | | |
|------------------------------|----------------|--|-------------------------------|--|--|
| Residential Real Property | 98 | Meets generally accepted mass appraisal practices. | No recommendation. | | |
| | | | • | | |
| Commercial Real Property | 94 | Meets generally accepted mass appraisal practices. | No recommendation. | | |
| | | | | | |
| Agricultural Land | 70 | Meets generally accepted mass appraisal practices. | No recommendation. | | |
| | <u> </u> | | 1 | | |

**A level of value displayed as NEI (not enough information) represents a class of property with insufficient information to determine a level of value.

Dated this 9th day of April, 2012.

Residential Reports

2012 Residential Assessment Actions for Gage County

Gage County conducted a sales analysis and reviewed the statistics for the residential class of property. For 2012 the valuation group that includes the town of Cortland was reviewed. For the review the contract appraiser verified all of the sales and constructed a model. A drive by review was completed for all properties, and the condition was updated for the improvements. New photos were taken and the property record card was updated.

Gage County is on track to complete the six year assessment cycle. The county relies on an appraisal assistant in the office in addition to the contract appraiser. The County completed all of the pickup, and permit work for the residential class.

2012 Residential Assessment Survey for Gage County

| 1. | Valuation d | lata collection done by: | | | | | | | |
|----|---------------------------|---|--|--|--|--|--|--|--|
| | Assessor staff | | | | | | | | |
| 2. | In your op | inion, what are the valuation groupings recognized in the County | | | | | | | |
| | | be the unique characteristics of each grouping: | | | | | | | |
| | Valuation | Description of unique characteristics | | | | | | | |
| | Grouping | | | | | | | | |
| | | Gage County addresses the residential class by using each incorporated area as its own valuation group. During their sales analysis they complete a market study at a minimum by reviewing the statistical analysis provided in the state sales file and by reviewing and verifying the sales throughout the year. The County has a systematical review process in place to meet the six year review cycle. The county contends that each of the valuation groups has its | | | | | | | |
| | | own unique market and that any adjustments are only considered within the confines of these valuation groups. The groups correspond with the appraisal cycle in the County so that any adjustment outside the valuation grouping strata would tend to cause a disparate treatment of the class. | | | | | | | |

| 3. | List and d residential | lescribe the approach(es) used to estimate the market value of properties. | | | | | | | |
| | | ty uses a market approach that is tied to the RCN, based on RCN less | | | | | | | |
| | | d depreciation. | | | | | | | |
| 4 | | e costing year of the cost approach being used for each valuation | | | | | | | |
| | grouping? | | | | | | | | |
| | 2010 | | | | | | | | |
| 5. | | t approach is used, does the County develop the depreciation based on local market information or does the county use the tables | | | | | | | |

| | provided by the CAMA vendor? |
|-----|--|
| | The county does not use the cost approach solely in developing market value. The |
| | County utilizes market studies for each valuation grouping. The depreciation is |
| | based on local market information. |
| 6. | Are individual depreciation tables developed for each valuation grouping? |
| | Yes, In conjunction with the market analysis. |
| 7. | When were the depreciation tables last updated for each valuation grouping? |
| | During the review cycle outlined in the 3 year plan for the County. |
| 8. | When was the last lot value study completed for each valuation grouping? |
| | 2010 |
| 9. | Describe the methodology used to determine the residential lot values? |
| | The County uses a sales comparison approach, in the valuation group of Beatrice it |
| | is applied on a square foot basis. For the rest of the groups they are valued by lot |
| | with adjustments for larger vacant parcels. |
| 10. | How do you determine whether a sold parcel is substantially changed? |
| | If additions to structures as well as new improvements have been added on the |
| | parcel. The county, during the sales verification determines if the change to the |
| | parcel has a substantial effect on the market value of the property. |

A. Residential Real Property

Gage County is located in southeast Nebraska. The largest town and county seat is Beatrice which is centered in the County. Gage is bordered to the south by the state of Kansas. Lancaster County is directly north of Gage County. The eastern border of the County is shared with Johnson and Pawnee counties, with Saline and Jefferson to the west. Gage County has seen a decline in population over the past 10 years and the economic trend is relatively flat. The residential market in the county is seeing a slight decline as evidenced by the statistical profile.

The sales file consists of 432 qualified residential sales and is considered to be an adequate and reliable sample for the residential class of property. Two of the measures of central tendency are within the acceptable range with only the mean being outside the range by 9 points. In reviewing the statistical report the effect of low dollar sales on the mean is evident. The mean drops into the range when excluding the sales under 30,000. All of the valuation groups with an adequate sample of sales fall within the acceptable range. The counties valuation groups represent the assessor locations in the county and they represent the appraisal cycle of the county more than unique markets.

Gage County has a consistent procedure for sales verification. The county uses a sales questionnaire to verify sale price as well as gathering detailed information pertaining to the transaction. The contract appraiser completes a statistical review of all sales in the file. A physical inspection is completed on any sales with a perceived discrepancy and on all sales in conjunction with a review of a valuation group. The county utilizes an acceptable portion of available sales and there is no evidence of excessive trimming in the file.

The appraiser also conducted a sales analysis of all the assessor locations and continually updates the sales books for the residential class of properties. The County reviewed the town of Cortland for 2012. The review consisted of a physical inspection and verification by the contract appraisal company.

The County has a consistent approach to valuing and reviewing the property in Gage County. They utilize a contract appraiser and also have an appraiser assistant in the office. The known assessment practices are reliable and consistent and the residential class is treated uniformly and proportionately. The County has a web site for parcel searches with GIS capabilities.

Based on the consideration of all available information, the level of value is determined to be 98% of market value for the residential class of property, and all subclasses are determined to be valued within the acceptable range.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

2012 Correlation Section for Gage County

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less. Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less. Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

County 34 - Page 20

2012 Commercial Assessment Actions for Gage County

For 2012 the County conducted a statistical analysis and concluded that no adjustments were necessary in the commercial class of property. The contract appraiser continually verifies the commercial sales. Included in the verification the appraiser conducts an on-site interview and inspection on all commercial sales. The county also completed pickup work and permit work for the class.

Commercial Correlation

A. Commercial Real Property

Gage County is located in southeast Nebraska. The largest town is Beatrice which is centered in the County. Gage is bordered to the south by the state of Kansas. Lancaster County is directly north of Gage County. The eastern border of the County is shared with Johnson and Pawnee counties, with Saline and Jefferson to the west. Gage County has seen a decline in population over the past 10 years and the economic trend is relatively flat.

The 2012 Gage County commercial statistical profile reveals a total of 35 qualified commercial sales to be used as a sample for the three-year study period. The calculated median is 94. The profile indicates that all of the three measures of central tendency are within the acceptable range. Regarding the qualitative statistical measures, the COD and the PRD are both in the recommended range.

Valuation group 01, which represents Beatrice, is the only group with a large enough sample for any meaningful analysis. Valuation group 50 represents the remainder of the County, which includes 5 occupancies and includes 6 assessor locations (towns). This valuation group has such variability and without any organized market that attempting to rely on a calculated level of value for the group in my opinion would be ill advised.

Gage County was selected for an expanded AVU (Assessed Value Update) review of the commercial class of property in 2011. The AVU value was audited to see if it matched the value on the property record card for 2011. The values were also compared to unsold neighboring properties with the same occupancy where available. There was no indication of selective valuation in Gage County.

The contract appraiser reviews and verifies all commercial sales in the County. The appraiser conducts a physical inspection in conjunction with the sales verification. The appraiser has worked in Gage County for a number of years and coordinated the review of all commercial properties that was completed for the tax year 2010. It appears that the County uses all available sales and there is no indication of excessive trimming. It is believed that the assessment practices of the County produce an overall uniform and proportionate treatment of commercial property.

Based on the consideration of all available information, the level of value is determined to be 94% of market value for the commercial class of property, and all subclasses are determined to be valued within the acceptable range.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

2012 Correlation Section for Gage County

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less. Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less. Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

Agricultural and/or Special Valuation Reports

2012 Agricultural Assessment Actions for Gage County

The County conducted an analysis on the agricultural sales in the study period. Part of the annual review consists of the analysis of the market areas used in the County. For 2012 Gage County continues the use of two market areas.

The county adjusted values in both market areas to bring the level of assessment within the acceptable range. The county continually reviews sales by verifying sale prices and land use. The County completed permit and pickup work for the agricultural class of property for 2012.

GAGE COUNTY ASSESSOR'S OFFICE 612 Grant, Room 8 Beatrice, NE 68310 Phone: (402) 223-1308

Patricia L. Milligan, Assessor

Loreene Stein, Deputy Asssessor

REPORT OF SPECIAL VALUATION PROCEDURES/METHODOLOGY

FOR ASSESSMENT YEAR 2012

MARCH 1, 2012

• GENERAL INFORMATION:

On December 1, 1999, the Gage County Board of Supervisors officially adopted temporary zoning regulations for the county. At their December 29, 1999 Board Meeting, Resolution 1033 was passed stating that the special valuation or greenbelt provision would be available in Gage County beginning with the tax year 2000 and that the Gage County Assessor would implement the special valuation or greenbelt provision beginning with tax year 2000 for those land owners who make application on the prescribed form and meet all qualifying criteria.

The special valuation or greenbelt provision was implemented to recognize influences on sales of agricultural/horticultural land where such influences were other than agricultural/horticultural purposes. These non-agricultural/ horticultural influences include, but are not limited to, residential, commercial, investment, or recreational. By recognizing these influences, the assessed value determination can be based on the lands value as if the lands only use is for agricultural/horticultural purposes.

Gage County lies adjacent to Lancaster County on the north and approximately 20 miles south of Lincoln. Additionally, U.S. Highway 77 from Lincoln south through Cortland into Beatrice has been reconfigured from a two lane road to a four lane Highway providing for easy access to Lincoln and Interstate Highway 80 with convenient Interstate access east and west from all areas of Gage County. During previous years, a proliferation of rural residential subdivisions had influenced the sale price of agricultural/horticultural land. Additionally, sales of agricultural/horticultural land within close proximately to the city of Beatrice reflected development or developmental potential for residential and/or commercial uses.

At the time we initiated the Special Valuation or Green Belt provisions, our review of sales along with our sale verification procedures indicated that agricultural/horticultural sales in Gage County, with the exception of the southwestern most portion of Gage County, were influenced by non-agricultural/horticultural influences. Later studies determined those same non-agricultural/horticultural influences were being experience throughout the county. However, recent sales studies and sale verifications indicate the non-agricultural/horticultural influences on sales of agricultural/horticultural land throughout the county no longer exists.

- Since 1994, Gage County has been divided into agricultural or horticultural • neighborhoods for valuation purposes. Initially, the county was divided into two areas-north of Highway 136 and south of Highway 136. Subsequently, a study and sales review by Great Plains Appraisal Company of Lincoln recommended the division of the county into three neighborhoods. These neighborhood or area boundaries were redefined in 1995 and the county was divided into four areas. The four neighborhood areas were further refined for tax year 2002 with the addition of a neighborhood or area 5 made up of townships or portion of townships from existing areas 2 and 3. There has been further minor realignment of neighborhood boundaries during subsequent years. The county neighborhoods were developed to account for the different market influences and reactions on similar type land capability groups and soil classes throughout the county. For tax year 2008, an analysis of sales along with an analysis of the soil makeup of the county (results of a new soil survey), resulted in a major realignment of neighborhoods dividing the county into two neighborhoods-neighborhood 1 consisting of all townships except the southeastern three most townships and neighborhood 2 consisting of those townships.
- Methodology (influenced or recapture value):

In determining recapture value of agricultural/horticultural land, Gage County utilizes the sales comparison approach. It is recognized in the appraisal of real property that sale prices of comparable properties are usually considered the best evidence of market value. It is further recognized that when selecting comparable sales, they are selected based on their similarity to the subject property.

All agricultural/horticultural qualified sales are reviewed and analyzed by neighborhood and, at the same time, each neighborhood is reviewed for possible realignment. In determining recapture values within each neighborhood, arms length sales are broken down and grouped by similar number of acres sold (i.e.<40 acres, 40-100 acres, etc.), similar predominate soil classes (i.e. Class 1, Class 2 etc.); and similar land groups (ie. Irrigated, Dry land etc.) and plotted on a sale spreadsheet. Difference in the number of acres in each land capability group for each sale is taken in the analysis. From this data, we determine ranges of value and the most appropriate value for each land capability group. In accordance with existing state statutes, agricultural/horticultural land is assessed at 75% of market value.

• Methodology (Uninfluenced or "special value")

Initially, our analysis indicated that agricultural sales in the southwestern most portion of Gage County did not have the nonagricultural or horticultural influences that were being experienced in other areas of Gage County. Subsequent analysis indicated these

Nonagricultural/horticultural influences existed in all areas of Gage County. However, recent sales studies and sale verifications indicate that non agricultural/horticultural influences on sales of agricultural/horticultural land throughout the county no longer exists and that sales of agricultural/horticultural land in Gage County are as if the lands only available use is for agricultural/horticultural purposes.

To verify and support our conclusions, we developed a "base" areas outside of Gage County to develop comparison values. Since the adjoining counties of Saline, Jefferson, Johnson, and Pawnee do recognize not nonagricultural/horticultural influences occurring in their agricultural/horticultural land sales, we reviewed sales in these counties to develop a range of values. We reviewed and analyzed qualified sales in each of the adjacent townships of those adjoining counties. Our analysis of the qualified sales utilized the same methodology as we used in developing the recapture value for Gage County. From our analyses, we developed a range of values for each land capability group. Based on the values developed in the adjoining non special value counties and comparing with the recapture values developed for Gage County, the indication was no significant differences existed between special or green belt values and recapture values. This conclusion was supported by our sales verification process which indicated that non-agricultural/horticultural influences on the value of Gage County agricultural/horticultural no longer existed.

Agricultural and/or Special Valuation Correlation

A. Agricultural Land

Gage County is located in southeast Nebraska. The County is bordered by Kansas to the south, Jefferson and Saline counties to the west, Johnson and Pawnee to the east, and Lancaster to the north. Gage County is comprised of approximately 11% irrigated land, 64% dry crop land and 22% grass/pasture land. Annually sales are reviewed and plotted to verify accuracy of the market area determination. For 2012 Gage County has two market areas the same as the past several years. The county contends that topography and soils as well as the overall size of fields affect the market values for land between the two areas. Also less than two percent of the agricultural land in market area 2 is irrigated.

The agricultural market in the County along with the area and state is seeing a rapid increase and has for the past several years. 120 qualified agricultural sales were used in the agricultural analysis for the three year study period. The statistical sample consists of sales that meet the required balance as to date of sale and are proportionate by majority land use. This was met by including comparable sales from the same general agricultural market all within six miles of the subject county.

Market area one can be described as the entire county with the exception of the three townships bordering Pawnee County. The majority land use for area one closely mirrors the county totals, 13% irrigated, 64% dry and 21% grass. Gage County has 99 qualified sales in the statistical profile for area one for the three year study period. In analyzing by the 80 per cent majority land use for the market area all three are within the acceptable range.

Area two is made up of the three townships that border Pawnee County. For area two there are 21 sales in the statistical profile for the three year study period. Area two consists of 64% dry land and 31% grass land. In analyzing the 80% majority land use by market area only the grass is in the range with the dry land below the range, but in looking at the 90% majority land use the dry land is above the range. Both of these majority land use groups for area two have few sales. In comparing the values per acre with Pawnee County they are relatively close in the LCG's that make up the majority of the two counties namely 2D, 3D1, and 4D1(80% of dry in Gage area 2 and 83% of dry in Pawnee). For area one, a review of the neighboring counties, shows that the 2012 values in Gage County are within the range of neighboring counties. It is difficult for a full comparison due to the fact of seven different market areas adjoining area one.

Based on the consideration of all available information, the level of value is determined to be 70% of market value for the agricultural class of real property. Because the known assessment practices are reliable and consistent it is believed that the agricultural class of property is being treated in the most uniform and proportionate manner possible.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

2012 Correlation Section for Gage County

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less. Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less. Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

Gage County 3-Year Plan June 2011

Budget, Staffing, and Contracts

Budget

2011-2012 Proposed Budget =\$234,240 (including salaries) 3500 is allotted for education, lodging, and other travel related expenses. \$8000 for a used vehicle.

Appraisal Maintenance \$45,000 (Contracted)

Budget Comments

I would like to hire a full time appraiser for Gage County at some point in time. In my estimation an appraiser's salary would run in the range of \$40,000 to \$45,000. With the economy issues, this will need to be put on hold.

<u>Staff</u>

Assessor: assumes responsibility for all functions within the office and prepares all necessary reports and documents

Deputy Assessor: assists the Assessor with all functions within the office and also helps in the building of the GIS system.

Real Property Appraisal Technician: responsible for all 521's, updating and developing the GIS system. Creates Sales File.

Personal Property Clerk: responsible for all personal property filed in the county, also assists in updating real estate records including sketching, and entering data for the reappraisals. Keeps all records concerning building permits filed. General office duties. Assisting taxpayers.

Clerk: responsible for assisting taxpayer and maintaining homestead exemption records, permissive exemption records, sending out sales review questionnaires. She assists with data entry within the CAMA system, answers phones, and performs other general office duties.

Appraiser Assistant: Performs all appraisal maintenance and pickup work.

Part-time County Appraiser

Bob Thoma is now a county employee. His responsibilities include developing valuation studies, for agricultural properties.

Contract Appraiser

Darrell Stanard is contracted for 4 days a month. His responsibilities include sales verification, appraisal maintenance and pricing pickup work and developing valuation studies.

County 34 - Page 56

3 Year Appraisal Plan

<u>2012</u>

Residential

For 2012 a plan for an appraisal maintenance will be done for all Beatrice residential properties. Review in- house preliminary statistical information and analyze for any possible subclass adjustments needed to comply with statistical measures as required by law. Sales review and pickup work will also be completed. New Pictures will be taken and a drive by review of the property will be done to see if any changes have been made.

Commercial

For 2012 a plan for an appraisal maintenance will be done for all commercial properties. Review in house preliminary statistical information and analyze for any possible subclass adjustments needed to comply with statistical measures as required by law. Sales review and pickup work will also be completed.

Agricultural

A market analysis of agricultural sales by land classification group will be conducted to determine any possible adjustments to comply with statistical measures. Sales will be plotted on a map to determine if the current market areas are supported by the current sales. The market analysis is conducted in house by Bob Thoma by utilizing the county's current CAMA system. Sales review and pick-up work will also be completed for agricultural properties. Rural residential properties will also be reviewed and analyzed for any adjustments needed to comply with statistical measures required by law. Vacant agland is being reviewed by our GIS and also by drive by inspections to determines changes in the land.

<u>2013</u>

Residential

For 2013 the county will continue reviewing Beatrice residential properties (2 year project). A new photo will be taken and any changes that may have occurred to the property will be updated. All other residential properties will be reviewed in house with preliminary statistical information and any possible subclass adjustments needed to comply with statistical measures as required by law. Sales review and pick-up work will also be completed.

Commercial

There will be an appraisal maintenance for the commercial properties in 2013. Appraisal adjustments may be needed in order to comply with statistical measures required by law. Sales review and pick-up work will also be completed for commercial properties.

Agricultural

A market analysis of agricultural sales by land classification group will be conducted to determine any possible adjustments to comply with statistical measures required by law. Rural residential properties will be reviewed and analyzed for any adjustments needed to comply with statistical measures.

<u>2014</u>

Residential

For 2014 a plan for an appraisal maintenance will be done for all residential properties. Review in house preliminary statistical information from our sales file and adjust values to comply with statistical measures required by law. Sales review and pickup work will also be completed.

Commercial

There will be an appraisal maintenance for commercial properties in 2014. New photos will be taken and a review of the property to see if any changes were made to the property. Appraisal adjustments may be needed in order to comply with statistical measures required by law. Sales review and pickup work will also be completed.

Agricultural

A market analysis of agricultural sales by land classification group will be conducted to determine any possible adjustments to comply with statistical measures. Rural residential properties will be reviewed and analyzed for any adjustments needed to comply with statistical measures.

Patricia Milligan, Gage County Assessor

Date:

2012 Assessment Survey for Gage County

A. Staffing and Funding Information

| 1. | Deputy(ies) on staff: |
|-----|---|
| | 1 |
| 2. | Appraiser(s) on staff: |
| | 0 |
| 3. | Other full-time employees: |
| | 4 |
| 4. | Other part-time employees: |
| | 1 |
| 5. | Number of shared employees: |
| | 0 |
| 6. | Assessor's requested budget for current fiscal year: |
| | 226,239 |
| 7. | Adopted budget, or granted budget if different from above: |
| | 234,239 Board added for a vehicle for the assessor office |
| 8. | Amount of the total assessor's budget set aside for appraisal work: |
| | 32,045 (lister and ag analysis) |
| 9. | If appraisal/reappraisal budget is a separate levied fund, what is that amount: |
| | 42,500 |
| 10. | Part of the assessor's budget that is dedicated to the computer system: |
| | Terra Scan comes out of County General, GIS funding is also budgeted out of the |
| | County General. |
| 11. | Amount of the assessor's budget set aside for education/workshops: |
| | 3,500 |
| 12. | Other miscellaneous funds: |
| | 0 |
| 13. | Amount of last year's assessor's budget not used: |
| | Nominal amount |

B. Computer, Automation Information and GIS

| 1. | Administrative software: |
|----|--|
| | TerraScan |
| 2. | CAMA software: |
| | TerraScan |
| 3. | Are cadastral maps currently being used? |
| | Yes |
| 4. | If so, who maintains the Cadastral Maps? |
| | Assessor staff |
| 5. | Does the county have GIS software? |

| | Yes |
|----|--|
| 6. | Is GIS available on a website? If so, what is the name of the website? |
| | Yes, http://gage.assessor.gisworkshop.com/ |
| 7. | Who maintains the GIS software and maps? |
| | Assessor staff |
| 8. | Personal Property software: |
| | TerraScan |

C. Zoning Information

| 1. | Does the county have zoning? |
|----|--|
| | Yes |
| 2. | If so, is the zoning countywide? |
| | Yes |
| 3. | What municipalities in the county are zoned? |
| | All with the exception of Ellis, Rockford, Holmesville, and Lanham |
| 4. | When was zoning implemented? |
| | 2000 |

D. Contracted Services

| 1. | Appraisal Services: |
|----|---------------------|
| | Stanard Appraisal |
| 2. | Other services: |
| | GIS Workshop |
