2012 Opinions of the Property Tax Administrator for Rock County

My opinions and recommendations are stated as a conclusion based on all of the factors known to me regarding the assessment practices and statistical analysis for this county. See, Neb. Rev. Stat. § 77-5027 (2011). While the median assessment sales ratio from the Qualified Statistical Reports for each class of real property is considered, my opinion of the level of value for a class of real property may be determined from other evidence contained within these Reports and Opinions of the Property Tax Administrator. My opinion of quality of assessment for a class of real property may be influenced by the assessment practices of the county assessor.

Class	Level of Value	Quality of Assessment	Non-binding recommendation		
Residential Real Property	97	Meets generally accepted mass appraisal practices.	No recommendation.		
Commercial Real Property	*NEI	Meets generally accepted mass appraisal practices.	No recommendation.		
Agricultural Land	72	Meets generally accepted mass appraisal practices.	No recommendation.		

^{**}A level of value displayed as NEI (not enough information) represents a class of property with insufficient information to determine a level of value.

Dated this 9th day of April, 2012.

2012 Residential Assessment Actions for Rock County

For assessment year 2012 the rural residential properties were inspected and reviewed with changes being implemented for 2012.

Pickup work was completed and placed on the assessment roll.

2012 Residential Assessment Survey for Rock County

1.	Valuation d	lata collection done by:										
	Assessor an	d Deputy										
2.		In your opinion, what are the valuation groupings recognized in the County and describe the unique characteristics of each grouping: Valuation Description of unique characteristics										
	Grouping	<u>Bescription of unique enuraciensities</u>										
	01	Bassett- all improved and unimproved properties located within the										
		City of Bassett. The population is approximately 740. The City										
		consists of various services and goods such as two banks,										
		convenience/gas store, restaurants, hardware/lumberyard store,										
		grocery store, local newspaper, and sale barn.										
	02	Bassett Suburban and Bassett Suburban Vacant- all improved and										
		unimproved properties located outside of the limits of the City of										
		Bassett, but within the legal jurisdiction of the incorporated City.										
	03	Newport, Newport Suburban- all improved and unimproved										
		properties located within the Village of Newport. Also, all improved										
		and unimproved properties located outside of the limits of the Village										
		of Newport, but within the legal jurisdiction of the incorporated										
		Village. Newport's population is approximately 136 and consists of a										
	04	convenience/gas station along HWY 20 and a post office.										
	04	Rural- all improved and unimproved properties located outside the City limits in the rural areas.

A. Residential Real Property

The statistical sampling of 25 residential sales will be considered an adequate and reliable sample for the measurement of the residential class of property in Rock County. The calculated median is 97%. The mean is above and the weighted mean is slightly below the acceptable ranges, the high mean can be attributed to outlier sales. The qualitative measures are also above the acceptable thresholds but can be attributed to low dollar sales. When hypothetically removing these sales from the analysis both these measures improve. Based on the known assessment practices it is believed the residential properties are being treated in a uniform and proportionate manner.

Residential sales are reviewed to determine if they are arms length transactions by sending questionnaires to the seller and buyer to gather as much information about the sale as possible. Phone calls are also made when there are further questions regarding the sale. Many times sellers or buyers come to the assessor's office and details of the sale are discussed at that time.

The assessor has a documented process of tracking the six-year inspection and review cycle of properties in the county.

This past year the Division has implemented an expanded review of one-third of the counties within the state to review assessment practices. Rock County was one of those selected for review in 2011. Based on the findings from that review it was determined the assessment practices are reliable and being applied consistently to the residential class of property. All property is being treated in the most uniform and proportionate manner possible.

Based on the consideration of all available information, the level of value is determined to be 97% of market value for the residential class of property.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

2012 Commercial Assessment Actions for Rock County

up work.													

2012 Commercial Assessment Survey for Rock County

1.	Valuation data collection done by:											
	Assessor and Deputy											
2.	_	inion, what are the valuation groupings recognized in the County be the unique characteristics of each grouping:										
	Valuation	Description of unique characteristics										
	Grouping											
	Bassett- all improved and unimproved properties located within the City of Bassett. The population is approximately 740. The City consists of various services and goods such as two banks convenience/gas store, restaurants, hardware/lumberyard store grocery store, local newspaper, and sale barn.											
	02	Suburban- all improved and unimproved properties located outside of the limits of the City of Bassett and Newport, but within the legal jurisdiction of the incorporated City.										
	03	Newport- all improved and unimproved properties located within the Village of Newport. Newport's population is approximately 136 and consists of a convenience/gas station along HWY 20, post office, and a grocery store.										
	04	Rural- all improved and unimproved properties located outside the City limits in the rural areas.										
3.	List and d	lescribe the approach(es) used to estimate the market value of										
		l properties.										
		pproach is used as well as a market analysis of the qualified sales to market value of properties.										
3a.	Describe th	e process used to value unique commercial properties.										
	situation ar	e the assessor hasn't had any unique properties to value. When the rises similar properties in surrounding counties would be used as as well as properties statewide.										
4.	grouping?	e costing year of the cost approach being used for each valuation										
	2006											
5.	study(ies) by provided by	t approach is used, does the County develop the depreciation based on local market information or does the county use the tables y the CAMA vendor?										
		ation study is developed based on local market information.										
6.	Are individ	ual depreciation tables developed for each valuation grouping?										
7	-	the depreciation tables last undated for each valuation granning?										
7.	2006	the depreciation tables last updated for each valuation grouping?										
8.	When was	the last lot value study completed for each valuation grouping?										
	2006											

9.	Describe the methodology used to determine the commercial lot values.
	A vacant land sales analysis was performed.
10.	How do you determine whether a sold parcel is substantially changed?
	A parcel is considered to be substantially changed when improvements are added
	that significantly affect the value such that the parcel no longer represents what sold.
	These sales are discussed with the field liaison as well.

A. Commercial Real Property

The statistical sample for the commercial class of property is made up of 6 sales and will not be relied upon to determine a level of value for Rock County. Further stratification of the sample by occupancy codes displays one sale per code. With the diversity of sales the representativeness of the sample to the population is unreliable.

Commercial sales are reviewed to determine if they are arms length transactions by sending questionnaires to the seller and buyer to gather as much information about the sale as possible. Phone calls are also made when there are further questions regarding the sale. Many times sellers or buyers come to the assessor's office and details of the sale are discussed at that time.

The assessor has a documented process of tracking the six-year inspection and review cycle of properties in the county.

This past year the Division has implemented an expanded review of one-third of the counties within the state to review assessment practices. Rock County was one of those selected for review in 2011. Based on the findings from that review it was determined the assessment practices are reliable and being applied consistently to the commercial class of property. All property is being treated in the most uniform and proportionate manner possible.

Based on the consideration of all available information, the level of value cannot be determined for the commercial class of property.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

2012 Agricultural Assessment Actions for Rock County

For assessment year 2012 the assessor performed a market analysis on all qualified agricultural sales. Based on the analysis it was determined the irrigated, dry land and CRP values would be raised.

The Assessor and Deputy reviewed the 2011 aerial photos that were flown by GIS Workshop. All land use changes were physically reviewed and verified by the assessor. All rural improvements were also physically reviewed and inspected with June 2010 cost tables being implemented. Rock County would like to have the aerial photos flown every six years. This is a very helpful and time saving tool for the county.

All pick up work and sales verification was completed for assessment year 2012.

^{*}Land capability grouping averages calculated using data reported on the 2012 Form 45, Abstract of Assessment

A. Agricultural Land

Rock County is located in north central Nebraska with Bassett being the county seat. The county is comprised of approximately 8% irrigated, 1% dry crop and 89% grass/pasture land. Rock County has three market areas. In area 1 the majority is hay meadow and pasture, area 2 consists of sand hills, and market area 3 is more of a mixture of hard grassland and irrigated. Generally, all of Brown, Keya Paha, Holt, northwest Garfield, Loup and northeast Blaine Counties are comparable to Rock. These areas share characteristics with Rock County that are comparable in soils and topography. Four Natural Resource Districts split this county. The Lower Niobrara NRD governs the very northern part of the county; the Middle Niobrara governs a very small portion in the northwest and does have a moratorium and well restrictions. The Lower Loup NRD governs the southwest part of the county, while the Upper Elkhorn governs the largest part of the county and currently has a 2500 acre annual new well maximum.

Agricultural sales are reviewed to determine if they are arms length transactions by sending questionnaires to the seller and buyer to gather as much information about the sale as possible. Phone calls are also made when there are further questions regarding the sale. Many times sellers or buyers come to the assessor's office and details of the sale are discussed at that time.

In analyzing the agricultural sales within Rock County the land use of the sales in each market area generally matched the County as a whole with exception to market area 3. In both market 1 and 3 the sales were proportionately distributed among the study years. However both samples were expanded using sales from the comparable areas to maximize the sample sizes while maintaining appropriate thresholds for land use representation. In market 2 even though the land use of the sales matched the market area as a whole the sample of sales are more heavily weighted with new sales. The way the sales are distributed over the study period may cause this area to be compared to a different time standard than others as the first and second years of the study period are under-represented in comparison to the third year. Therefore the sample of market 2 was expanded using sales from the comparable markets.

The resulting sample for each of the three market areas are now proportionately distributed, representative of the majority land uses found in the population and large enough to produce a reliable measurement. The overall statistics are a result of 95 total sales with 20 sales in area 1, 37 sales in area 2 and 38 sales in area 3. All statistical indications support that assessments are acceptable and values are within the acceptable range. The coefficient of dispersion is low enough to suggest the statistics are reliable and lends support to using the calculated median to represent the level of value.

From the assessor's analysis of the agricultural market the grassland values countywide received very minimal changes. In comparison with adjoining counties grassland the values are reasonably similar to the comparable markets. Further analysis of the irrigated values in all three areas resulted in upward adjustments. Area 3 which contains the most irrigation received the biggest increase; however the assessor recognized the movement in the market and adjusted irrigated values upward in the other two areas as well. Even though there are not a lot of dry crop acres or sales the assessor has attempted to increase the values with the

market. Rock County has a consistent method of assigning and implementing agricultural land values, it is believed that the assessments are uniform and proportionate. When comparing these values to the similar adjoining county markets the indication is relatively similar movement in the market and the values appear fairly equalized across county lines.

Based on the consideration of all available information, the level of value is determined to be 72% of market value for the agricultural land class of property, and all subclasses are determined to be valued within the acceptable range.

B. Analysis of Sales Verification

Neb. Rev. Stat. § 77-1327(2) (2011) provides that all sales are deemed to be arms length transactions unless determined to be otherwise under professionally accepted mass appraisal techniques. The county assessor is responsible for the qualification of the sales included in the state sales file.

The Standard on Ratio Studies, International Association of Assessing Officials (2010), indicates that excessive trimming (the arbitrary exclusion or adjustment of arms length transactions) may indicate an attempt to inappropriately exclude arms length transactions to create the appearance of a higher level of value and quality of assessment. The sales file, in a case of excess trimming, will fail to properly represent the level of value and quality of assessment of the population of real property.

The Nebraska Department of Revenue, Property Assessment Division (Division) frequently reviews the procedures used by the county assessor to qualify sales to ensure bias does not exist in judgments made. Arms length transactions should only be excluded when they compromise the reliability of the resulting statistics. In cases where a county assessor has disqualified sales without substantiation, the Division may include such sales in the ratio study.

C. Measures of Central Tendency

There are three measures of central tendency calculated by the Division: median ratio, weighted mean ratio, and mean ratio. Since each measure of central tendency has strengths and weaknesses, the use of any statistic for equalization should be reconciled with the other two, as in an appraisal, based on the appropriateness of the use of the statistic for a defined purpose, the quantity of the information from which it was drawn, and the reliability of the data that was used in its calculation. An examination of the three measures can serve to illustrate important trends in the data if the measures do not closely correlate to each other.

The International Association of Assessing Officers (IAAO) considers the median ratio the most appropriate statistical measure for use in determining level of value for direct equalization; the process of adjusting the values of classes or subclasses of property in response to the determination of level of value at a point above or below a particular range. Since the median ratio is considered neutral in relationship to either assessed value or selling price, its use in adjusting the class or subclass of properties will not change the relationships between assessed value and level of value already present within the class or subclass of properties, thus rendering an adjustment neutral in its impact on the relative tax burden to an individual property. Additionally, the median ratio is less influenced by the presence of extreme ratios, commonly called outliers. One outlier in a small sample size of sales can have controlling influence over the other measures of central tendency. The median ratio limits the distortion potential of an outlier.

The weighted mean ratio is viewed by the IAAO as the most appropriate statistical measure for indirect equalization. The weighted mean, because it is a value weighted ratio, best reflects a comparison of the assessed and market value of property in the political subdivision. If the distribution of aid to political subdivisions must relate to the market value available for assessment in the political subdivision, the measurement of central tendency used to analyze level of value should reflect the dollars of value available to be assessed. The weighted mean ratio does that more than either of the other measures of central tendency.

If the weighted mean ratio, because of its dollar-weighting feature, is significantly different from the median ratio, it may be an indication of other problems with assessment proportionality. When this occurs, an evaluation of the county's assessment practices and procedures is appropriate to discover remedies to the situation.

The mean ratio is used as a basis for other statistical calculations, such as the price related differential and coefficient of variation. However, the mean ratio has limited application in the analysis of level of value because it assumes a normal distribution of the data set around the mean ratio with each ratio having the same impact on the calculation regardless of the assessed value or the selling price.

D. Analysis of Quality of Assessment

In analyzing the statistical data of assessment quality, there are two measures upon which assessment officials will primarily rely: the Coefficient of Dispersion (COD), and the Price Related Differential (PRD). Whether such statistics can be relied upon as meaningful for the population depends on whether the sample is representative.

The COD is commonly referred to as the index of assessment inequality. It is used to measure how closely the individual ratios are clustered around the median ratio and suggests the degree of uniformity or inaccuracy resulting in the assessments. The COD is computed by dividing the average deviation by the median ratio. For example, a COD of 20 means half of the ratios are 20 percent above or below the median. The closer the ratios are grouped around the median, the more equitable the assessment of property tends to be. Conversely, if the dispersion is quite large, there is a large spread in the ratios typically indicating a large spread around the median in the assessment of property, which results in an inequity in assessment and taxes. There is no range of acceptability stated in the Nebraska statutes for the COD measure. The IAAO recommended ratio study performance standards are as follows:

Single-family residences: a COD of 15 percent or less.

For newer and fairly homogeneous areas: a COD of 10 or less.

Income-producing property: a COD of 20 or less, or in larger urban jurisdictions, 15 or less.

Vacant land and other unimproved property, such as agricultural land: a COD of 20 or less.

Rural residential and seasonal properties: a COD of 20 or less.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 246.

In unusually homogeneous types of property low CODs can be anticipated; however, in all other cases CODs less than 5 percent may be indicative of non-representative samples or the selective reappraisal of sold parcels.

The PRD, also known as the index of regression, is a measurement of the relationship between the ratios of high-value and low-value properties to determine if the value of property has any influence on the assessment ratio. It is calculated by dividing the arithmetic mean ratio by the weighted mean ratio. The PRD provides an indicator of the degree to which high-value properties are over-assessed or under-assessed in relation to low-value properties. A PRD of 100 indicates there is no bias in the assessment of high-value properties in comparison to low-value properties. A PRD greater than 100 indicates the assessments are regressive, which means low-value properties tend to have a higher assessment ratio than high-value properties. The result is the owner of a low-value property pays a greater amount of tax in relation to value than the owner of a high-value property. Conversely, a PRD less than 100 indicates that high-value properties are over assessed in relation to low-value properties.

There is no range of acceptability stated in the Nebraska statutes for the PRD measure. The Standard on Ratio Studies, adopted by the International Association of Assessing Officers, January, 2010, recommends that the PRD should lie between 98 and 103. This range is

centered slightly above 100 to allow for a slightly upward measurement bias inherent in the PRD.

The PRD is calculated based on the selling price/assessed value in the sales file. This measure can be misleading if the dollar value of the records in the sales file is not proportionate to the dollar value of records in the population.

Mass Appraisal of Real Property, International Association of Assessing Officers, (1999), p. 239.

PURSUANT TO LB 263, THE ASSESSOR SHALL PREPARE A PLAN OF ASSESSMENT FOR THE COUNTY BOARD OF EQUALIZATION EACH YEAR ON OR BEFORE JUNE 15 DESCRIBING THE NEXT YEARS ASSESSMENT PLANS AND EACH OF THE NEXT TWO YEARS THEREAFTER.

ON OR BEFORE JULY 31 EACH YEAR, THE ASSESSOR SHALL PRESENT THE PLAN TO THE COUNTY BOARD OF EQUALIZATION AND ON OR BEFORE OCTOBER 31 EACH YEAR THE ASSESSOR SHALL MAIL A COPY OF THE PLAN WITH ANY ADJUSTMENTS TO THE DEPARTMENT OF REVENUE. THE ASSESSOR SHALL UPDATE THE PLAN EACH YEAR. THE PLAN AND ANY UPDATES SHALL EXAMINE THE LEVEL, QUALITY, AND UNIFORMITY OF ASSESSMENT IN THE COUNTY AND MAY BE DERIVED FROM A PROGRESS REPORT DEVELOPED BY THE DEPARTMENT AND PRESENTED TO THE

_ _ _ _ _ _ _ _

ASSESSOR ON OR BEFORE JULY 31.

Rock County has a total valuation for Real Property in 2011 of \$310,628,220. The Parcel count for Real Property in 2011 is 3033. Personal Property filings for 2011 were 323. Homestead Exemptions filed and approved by our office for 2011 totaled 139. Permissive Exemptions filed and approved by our office and the Rock County Commissioners for 2011 were 16.

The levels of value of real property in Rock County for tax year 2011 satisfy the requirements of Neb. Const. art. V111 §1, and Neb. Stat. §77-5023(Cum. Supp 2008).

2011 Sales Statistics Ratio as determined by the Tax Equalization Commission.

No changes in Residential value - Assessment Ratio - 97%
No changes in Commercial value - Assessment Ratio - 97.37
No changes in Agricultural land value - Assessment Ratio - 73%

New residential photos we taken in 2010 for 2011 year in Bassett and Newport. We updated improvement cost tables to June 2010. Our aerial photos are from 2010 and we will soon add the Rural Improvements fly-over photos completed by GIS Workshop this summer. We will continue to do our pickup work on a timely basis and this fall start checking for any changes reveled from the fly-over photos that may have been missed from prior years.

Our office will try to contact owners by phone prior to our visit as we prefer they can accompany us. Great effort will be made to try to schedule in advance our on-site inspection when they or a representative can be present. Our focus will be to look for changes and any additions that we might have missed from prior years. We will verify measurements are correct. We will not do an interior inspection unless we are invited in

and or the owner has given us prior permission if we notice there have been some renovation.

2012 - Review 2011 fly-over photo's for Rock County. We will review and update all Rural Improvements using the 2010 cost tables. Time will be the factor that will dictate if we update more than Area 2 in 2012. We started at the Southeast corner of the county and will continue with Area 1 and then finish with Area 3. This will continue until all the Rural Improvements are revalued.

2012 - We need to do a study of our Commercial Property. We have not had enough sales to actually have to do a revalue, but we will update the cost tables and revalue this class of property in 2013.

2013 - Review and Physical Inspection calendar-

Every parcel in the county needs to be looked at on a rotation or schedule over a six year period. I did look at most of the rural in the southeast of our county in the fall of 2010.

2010 - looked at southeast corner of Rock, done.

2011 - plan to look at the southwest,

2012 - the east center portion,

2013 - the west center portion,

2014 - the northeast portion and

2015 - the northwest in 2016.

GIS Workshop flew the county and provided us with updated aerial photos of the county in 2011 which helped our office establish a visual reference point for rural property for all improvements. Going forward the office would like to have GIS Workshop update our aerial photos every six years. I do not know the schedule for the Farm Service Agency aerial photo's. We will receive them from GIS Workshop as part of our contract each year they are taken.

2014 - The plan has been made to update cost tables for Improvements every 4 (four) years. This time frame will lessen the impact for taxpayers but will insure the office has been kept current. New tables and photo's will be used for Residential Properly for 2014 to be in effect for 2015, Commercial Property for 2016, Area 2 in 2016, Area 1 and 3 in 2017.

We continue to have talks with Brown, Keya Paha, Boyd and Holt Counties about an appraiser for our counties to assist us when needed. We always continue to work on our quality and uniformity of assessment.

Our budget for this year did not include much in the appraisal budget because it will be mainly work that we can do ourselves. Hopefully, the mileage numbers will be sufficient

to check the CRP acres along with the acres of dry land. These need to be physically checked for 2012.

Monica J Turpin Rock County Assessor

JUNE 15,2011

2012 Assessment Survey for Rock County

A. Staffing and Funding Information

1.	Deputy(ies) on staff:
	One
2.	Appraiser(s) on staff:
	None
3.	Other full-time employees:
	None
4.	Other part-time employees:
	None
5.	Number of shared employees:
	None
6.	Assessor's requested budget for current fiscal year:
	\$72,826
7.	Adopted budget, or granted budget if different from above:
	Same as above
8.	Amount of the total assessor's budget set aside for appraisal work:
	\$600
9.	If appraisal/reappraisal budget is a separate levied fund, what is that amount:
	N/A
10.	Part of the assessor's budget that is dedicated to the computer system:
	\$4,500
11.	Amount of the assessor's budget set aside for education/workshops:
	\$800
12.	Other miscellaneous funds:
	None
13.	Amount of last year's assessor's budget not used:
	\$2,589

B. Computer, Automation Information and GIS

1.	Administrative software:
	Terra Scan
2.	CAMA software:
	Terra Scan
3.	Are cadastral maps currently being used?
	Yes
4.	If so, who maintains the Cadastral Maps?
	GIS Workshop
5.	Does the county have GIS software?
	Yes

6.	Is GIS available on a website? If so, what is the name of the website?
	Yes – rock.assessor.gisworkshop.com
7.	Who maintains the GIS software and maps?
	GIS Workshop
8.	Personal Property software:
	Terra Scan

C. Zoning Information

1.	Does the county have zoning?
	Yes
2.	If so, is the zoning countywide?
	Yes
3.	What municipalities in the county are zoned?
	Bassett
4.	When was zoning implemented?
	1998

D. Contracted Services

1.	Appraisal Services:
	None
2.	Other services:
	None
